This monograph is the first survey of neural

approaches to conversational AI that targets Natural Language Processing and Information Retrieval audiences. It provides a comprehensive survey of the neural approaches to conversational AI that have been developed in the last few years, covering QA, task-oriented and social bots with a unified view of optimal decision making. The authors draw connections between modern neural approaches and traditional approaches, allowing readers to better understand why and how the research has evolved and to shed light on how they can move forward. They also present state-of-the-art approaches to training dialogue agents using both supervised and reinforcement learning. Finally, the authors sketch out the landscape of conversational systems developed in the research community and released in industry, demonstrating via case studies the progress that has been made and the challenges that are still being faced. Neural Approaches to Conversational AI is a valuable resource for students, researchers, and software developers. It provides a unified view, as well

as a detailed presentation of the important ideas and insights needed to understand and create modern dialogue agents that will be instrumental to making world knowledge and services accessible to millions of users in ways that seem natural and intuitive.

Although "the Socratic method" is commonly understood as a style of pedagogy involving cross-questioning between teacher and student, there has long been debate among scholars of ancient philosophy about how this method as attributed to Socrates should be defined or, indeed, whether Socrates can be said to have used any single, uniform method at all distinctive to his way of philosophizing. This volume brings together essays by classicists and philosophers examining this controversy anew. The point of departure for many of those engaged in the debate has been the identification of Socratic method with "the elenchus" as a technique of logical argumentation aimed at refuting an interlocutor, which Gregory Vlastos highlighted in an influential article in 1983. The essays in this volume look again at many of the issues to which Vlastos drew attention but also seek to broaden the discussion well beyond the limits

of his formulation. Some contributors question the suitability of the elenchus as a general description of how Socrates engages his interlocutors; others trace the historical origins of the kinds of argumentation Socrates employs; others explore methods in addition to the elenchus that Socrates uses; several propose new ways of thinking about Socratic practices. Eight essays focus on specific dialogues, each examining why Plato has Socrates use the particular methods he does in the context defined by the dialogue. Overall, representing a wide range of approaches in Platonic scholarship, the volume aims to enliven and reorient the debate over Socratic method so as to set a new agenda for future research. Contributors are Hayden W. Ausland, Hugh H. Benson, Thomas C. Brickhouse, Michelle Carpenter, John M. Carvalho, Lloyd P. Gerson, Francisco J. Gonzalez, James H. Leshner, Mark McPherran, Ronald M. Polansky, Gerald A. Press, François Renaud, and W. Thomas Schmid, Nicholas D. Smith, P. Christopher Smith, Harold Tarrant, Joanne B. Waugh, and Charles M. Young.

The understanding of how to reduce risk factors for mental disorders has expanded remarkably as a result of recent scientific advances. This study, mandated by Congress, reviews those advances in the context of current research and provides a targeted definition of prevention and a conceptual framework that emphasizes risk reduction. Highlighting opportunities for and barriers to interventions, the book draws on successful models for the prevention of cardiovascular disease, injuries, and smoking. In addition, it reviews the risk factors associated with Alzheimer's disease, schizophrenia, alcohol abuse and dependence, depressive disorders, and conduct disorders and evaluates current illustrative prevention programs. The models and examination provide a framework for the design, application, and evaluation of interventions intended to prevent mental disorders and the transfer of knowledge about prevention from research to clinical practice. The book presents a focused research agenda, with recommendations on how to develop effective intervention programs, create a cadre of prevention researchers, and improve coordination among federal agencies.

This monograph aims at presenting a unified approach to numerical modeling of tsunami as long waves based on finite difference methods for 1D, 2D and 3D generation processes, propagation, and runup. Many practical examples give insight into the relationship between long wave physics and numerical solutions and allow readers to quickly pursue and develop specific topics in greater depth. The aim of this book is to start from basics and then continue into applications. This approach should serve well the needs of researchers and students of physics, physical oceanography, ocean/civil

engineers, computer science, and emergency management staff. Chapter 2 is particularly valuable as it fully describes the application of finite-difference methods to the study of long waves by demonstrating how physical properties of water waves, especially phase velocity, are connected to the chosen numerical algorithm. Basic notions of numerical methods, i.e. approximation of the relevant differential equations, stability of the numerical scheme, and computational errors are explained through application to long waves. Finite-difference methods are further developed in major chapters to deal with complex problems that arise in the study of recent tsunamis.

It should be time to study and apply a mathematical accounting model which is easy to understand and audit, and is accurate and reliable. The paper distinctly describes three accounting's concepts or models (physical accounting model, double-entry system model,

and mathematical accounting model) and their relationships. The physical accounting model naturally exists since business emerging and is the base of all other accounting models. The physical accounting model is actually consisted of every transaction which is based on a principle: exchange of equal values. The double-entry system model, which is still used all over the world, uses a logical method to keep recording transactions accurate. Its main characters are the T account with debit and credit, chart of accounts, two classes of permanent and temporary accounts, and trial balance. The mathematical accounting model is based on a basic expanding accounting equation and has developed following main characters: mathematical axiom principle, dynamic accounting equation, sub-equation of the dynamic accounting equation, five classes of permanent accounts, multi-subaccount name, structures of financial statements, and account flow statement. The same parts of the double-entry system and mathematical accounting models are to satisfy the basic accounting equation at the beginning of a fiscal year and the ending of a fiscal year, but the difference of them is that they take the different ways to reach the ending of the fiscal year. Based on the mathematical accounting model, I have developed a MathAccounting software. The MathAccounting software, which will be introduced in detail, has four function models: Transactions, Reports, Backup/Restore, and Maintenances. The MathAccounting software has little limitation, so it can be used by all economic entities regardless of their size, nature of business, and form of business organization without any altering. The paper also introduces a concept of the great accounting, which is based on the MathAccounting software and the wealth conservation law, in detail. The great accounting means two aspects. In the great data time, centered management of accounting is an inexorable trend. Every business company can login in a government's centered database by using of its business number. And every department in an organization can do part work of the accounting about itself duty. All

works of the organization's departments will be made up of the financial statements. The great accounting has many advantages, such as being difficult to draw up false accounts and to evade a tax.

A new selection and translation of the work of Osip Mandelstam, perhaps the most important Russian poet of the twentieth century Political nonconformist Osip Mandelstam's opposition to Stalin's totalitarian government made him a target of the communist state. The public recitation of his 1933 poem known in English as "The Stalin Epigram" led to his arrest, exile, and eventual imprisonment in a Siberian transit camp, where he died, presumably in 1938. Mandelstam's work—much of it written under extreme duress—is an extraordinary testament to the enduring power of art in the face of oppression and terror. *Stolen Air* spans Mandelstam's entire poetic career, from his early highly formal poems in which he reacted against Russian Symbolism to the poems of anguish and defiant abundance written in exile, when Mandelstam became a truly great poet. Aside from the famous early poems, which have a sharp new vitality in Wiman's versions, *Stolen Air* includes large selections from *The Moscow Notebooks* and *The Voronezh Notebooks*. Going beyond previous translators who did not try to reproduce Mandelstam's music, Christian Wiman has captured in English—for the first time—something of Mandelstam's enticing, turbulent, and utterly heartbreaking sounds.
