Representatives of several scientific communities, such as planetary scientists, astronomers, space physicists, chemists and astrobiologists have met with the aim to review the knowledge on four major themes: (1) the study of the formation and evolution processes of the outer planets and their satellites, beginning with the formation of compounds and planetesimals in the solar nebula, and the subsequent evolution of the interiors of the outer planets, (2) a comparative study of the atmospheres of the outer planets and Titan, (3) the study of the planetary magnetospheres and their interactions with the solar wind, and (4) the formation and properties of satellites and rings, including their interiors, surfaces, and their interaction with the solar wind and the magnetospheres of the outer planets. Beyond these topics, the implications for the prebiotic chemical evolution on Europa and Titan are reviewed. At the time of publication, the study of the outer planets is particularly motivated by the fact that the Saturn system is being investigated by the Cassini-Huygens mission. Comparing human lifespans to the age of our planet, we consider the Earth as some kind of constant. But should we? According to the Old Testament and many ancient manuscripts, there were events and mythical characters that modern science can neither prove nor disprove. In fact, getting a scientific explanation of an event is much harder than witnessing it. That is why science is way behind religion, and our only hope for the future is to bridge the gap between them. In this book, the author explores why every generation struggles with reconciling the differences between science and religion. He seeks to answer questions such as: • Has the Earth always rotated in the same direction? • Were there any shifts of the poles on Earth? • Was the sea level always the

same? • Was the moon always there? While there are widely accepted theories on the origin of continents, oceans, mountains, lakes, and volcanoes, they all have their shortcomings. In this book, you'll discover a revolutionary approach that answers how our universe appeared and where we are going.
