The power of mapping: principles for visualizing knowledge, illustrated by many stunning large-scale, full-color maps. Maps of physical spaces locate us in the world and help us navigate unfamiliar routes. Maps of topical spaces help us visualize the extent and structure of our collective knowledge; they reveal bursts of activity, pathways of ideas, and borders that beg to be crossed. This book, from the author of Atlas of Science, describes the power of topical maps, providing readers with principles for visualizing knowledge and offering as examples forty large-scale and more than 100 small-scale full-color maps. Today, data literacy is becoming as important as language literacy. Well-designed visualizations can rescue us from a sea of data, helping us to make sense of information, connect ideas, and make better decisions in real time. In Atlas of Knowledge, leading visualization expert Katy Börner makes the case for a systems science approach to science and technology studies and explains different types and levels of analysis. Drawing on fifteen years of teaching and tool development, she introduces a theoretical framework meant to guide readers through user and task analysis; data preparation, analysis, and visualization; visualization deployment; and the interpretation of science maps. To exemplify the framework, the Atlas features striking and enlightening new maps from the popular "Places & Spaces: Mapping Science" exhibit that range from "Key Events in the Development of the Video Tape Recorder" to "Mobile Landscapes: Location Data from Cell Phones for Urban Analysis" to "Literary Empires: Mapping Temporal and Spatial Settings of Victorian Poetry" to "Seeing Standards: A Visualization of the Metadata Universe." She also discusses the possible effect of science maps on the practice of science.

An award-winning scientist offers his unorthodox approach to childrearing: "Parentology is brilliant, jaw-droppingly funny, and full of wisdom...bound to change your thinking about parenting and its conventions" (Amy Chua, author of Battle Hymn of the Tiger Mother). If you're like many parents, you might ask family and friends for advice when faced with important choices about how to raise your kids. You might turn to parenting books or simply rely on timeworn religious or cultural traditions. But when Dalton Conley, a dual-doctorate scientist and full-blown nerd, needed childrearing advice, he turned to scientific research to make the big decisions. In Parentology, Conley hilariously reports the results of those experiments, from bribing his kids to do math (since studies show conditional cash transfers improved educational and health outcomes for kids) to teaching them impulse control by giving them weird names (because evidence shows kids with unique names learn not to react when their peers tease them) to getting a vasectomy (because fewer kids in a family mean smarter kids). Conley encourages parents to draw on the latest data to rear children, if only because that level of engagement with kids will produce solid and happy ones. Ultimately these experiments are very loving, and the outcomes are redemptive—even when Conley's sassy kids show him the limits of his profession. Parentology teaches you everything you need to know about the latest literature on parenting—with lessons that go down easy. You'll be laughing and learning at the same time.

The proposition that there is a correlation between language and culture or culture-specific ways of thinking can be traced back to the views of Herder and von Humboldt in the late 18th and early 19th centuries. It is generally accepted today that a language, especially its lexicon, influences its speakers' cultural patterns of thought and perception in various ways, for example through a culture-specific segmentation of the extralinguistic reality, the frequency of occurrence of particular lexical

items, or the existence of keywords or key word combinations revealing core cultural values. The aim of this volume is to explore the cultural dimension of a wide range of preconstructed or semi-preconstructed word combinations in English. The 17 papers of the volume are divided into four sections, focusing on particular lexemes (e.g. enjoy and its collocates), types of word combinations (e.g. proverbs and similes), use-related varieties (such as the language of tourism or answering-machine messages), and user-related varieties (such as Aboriginal English or African English). The sections are preceded by a prologue, tracing the development of the study of formulaic language, and followed by an epilogue, which draws together the threads laid out in the various papers. The relation between language and culture in general has been explored in a number of important works over the past ten years. However, the study of the relation between English phraseology and culture in particular has been largely neglected. This volume is the first book-length publication devoted entirely to this topic.

Ford Motor Company is currently trying to increase its global market share in automobile sales while facing slumping market share numbers in the United States. This report examines the Ford company characteristics and how the company uses information systems in the business climate. To reduce costs and increase knowledge of a region Ford uses small ERP systems that are less expensive and faster to implement than the larger ERP systems. Failure to obtain a larger market share in foreign markets has hurt the company. The proper use of information systems by Ford will increase their ability to maintain a successful business in future years locally and globally.
