The following are the steps to perform paper chromatography. Step 1: Take a long rectangular piece of filter paper and draw a straight line on it using a pencil, a few centimeters above one of its shorter edges. This is your start line. Place a drop of the mixture on the start line, using a capillary tube.

Paper chromatography is a technique that involves placing a small dot or line of sample solution onto a strip of chromatography paper. The paper is placed in a container with a shallow layer of solvent and sealed. As the solvent rises through the paper, it meets the sample mixture, which starts to travel up the paper with the solvent. Paper Chromatography Welcome University Of

Paper chromatography works in few steps: Step 1: A horizontal line is drawn near one end (about 1.5 cm from the bottom edge) of the paper. In figure below 6 is the horizontal line. Step 2: The sample needs to be separated is placed as a small drop or line on to the paper using capillary tube. Labelling the drop by a pencil with an alphabet or number help to identify the compound later.

Paper chromatography is an analytical method used to separate colored chemicals or substances. It is primarily used as a teaching tool, having been replaced by other chromatography methods, such as thin-layer chromatography. A paper chromatography variant, two-dimensional chromatography involves using two solvents and rotating the paper 90 ° in between. This is useful for separating complex mixtures of compounds having similar polarity, for example, amino acids. The setup has three ...
