[SEL ARTICLES ON UNEMPLOYMENT](#) Edward Elgar Publishing
"A collection of policy papers."--T.p.
The Natural Rate of Unemployment Hardpress Publishing
The paper studies the employment effects of a deposit-refund scheme on labor in a simple search-theoretic model of the labor market. It is shown that if a firm pays a deposit to the government when it fires a worker, to be refunded when it employs the same or another worker, the vacancy rate increases and the unemployment rate declines. However, the scheme introduces rigidities in the labor market that may be undesirable in countries wanting to liberalize their labor markets.

[The Causes of Unemployment](#) Oxford ; New York : Clarendon Press
High and persistent unemployment rates in Europe during the eighties gave rise to a lively discussion about the nature and causes of joblessness. Among other sources structural unemployment was blamed for the lack of response of unemployment to increasing aggregate demand. Renewed attention was thus devoted to an analysis of the magnitude and the development of structural unemployment as well to its possible determinants. In this literature, the Beveridge curve experienced a resurrection and, at first glance, it seemed to be an appropriate tool to analyse the aforementioned issues. However, it was soon recognized that the Beveridge curve, i. e. the relation between unemployment and vacancies, was anything but stable, thus requiring a careful distinction between dynamic loops around a (stable?) long-run Beveridge curve and possible shifts due to, say, an increasing mismatch between labor supplied and demanded. The controversy is far from being settled at the time of this writing. This book contains a collection of hitherto unpublished papers which are devoted to a theoretical and econometric analysis of structural unemployment. The papers put considerable emphasis on the question to what extent the Beveridge curve can serve as an adequate tool for such studies. The countries under consideration are Germany and Austria. In what follows a very brief summary of each paper will be outlined. Franz and Siebeck present, at some length, a theoretical and econometric analysis of the Beveridge curve in Germany.

Contributors trace the origins of international unemployment to developments in the international trading and financial system since 1973, and suggest solutions and strategies for full employment in the UK, Europe, and the US. They conclude that the history of the international economy lends no support to the present model of a self-adjusting market system. Based on papers presented at the December 1993 New School Conference on Unemployment. Paper edition (unseen), \$21.95. Annotation copyright by Book News, Inc., Portland, OR

Excerpt from Selected Articles on Unemployment The subject of Unemployment has taken two aspects

among debaters - the establishment of public labor exchanges, and the supplying of municipal, state or national work when normal channels are inadequate to absorb surplus labor. The present volume is designed in particular to serve both of these questions, its emphasis being given to remedial schemes and their negation, while at the same time a full bibliography has been provided and an endeavor has been made also to include articles covering the general subject broadly, for the benefit of the outside reader and student. The brief and selection of articles first-arranged in affirmative and negative sequence are designed for the labor exchanges question. Following them is a selection of articles more directly on public work, in affirmative and negative sequence. The general references serve as an introduction to other schemes. The bibliography on the works question includes all forms of public provision of work, compulsory and voluntary, from wood yards to farm colonies, and from municipal to national undertakings. In the labor exchanges division of the bibliography (a W) and (n W) indicate additional articles on the affirmative and negative sides of the works remedy. The papers in this volume present an excellent sampling of the best of current research in labor economics, combining the most sophisticated theory and econometric methods with high-quality data on a variety of problems. Originally presented at a Universities-National Bureau Committee for Economic Research conference on labor markets in 1978, and not published elsewhere, the thirteen papers treat four interrelated themes: labor mobility, job turnover, and life-cycle dynamics; the analysis of unemployment compensation and employment policy; labor market discrimination; and labor market information and investment. The Introduction by Sherwin Rosen provides a thoughtful guide to the contents of the papers and offers suggestions for continuing research.

Unemployment and Inflation
The distinguished contributors in this volume provide a variety of essays, which are written in honor of Emmanuel Drandakis. These essays fall into four uniform areas of economics: economic growth, general equilibrium, labor economics and game theory and applications. The editors focus on a select set of issues that stand high on the agenda of academic research. They provide fresh insights and approaches to the analysis of these issues, and thus open up wider avenues for our understanding of the dilemmas posed for theory and policy. Readers are offered new empirical evidence on such thorny social problems as, for example, unemployment, the intergenerational transmission of human capital and the response of wages to price and endowment changes.
