The 6th IAA Symposium on Small Satellites for Earth Observation, initiated by the International Academy of Astronautics (IAA), was again hosted by DLR, the German Aerospace Center. The

participation of scientists, engineers, and managers from 24 countries reflected the high interest in the use of small satellites for dedicated missions applied to Earth observation. As in the previous symposia, the contributions showed that dedicated Earth observation missions cover a wide range of very different tasks. These missions provide increased opportunities for access to space and can be conducted relatively quickly and inexpensively. The spacecraft bus, the instruments, and the ground systems can be based either on optimized off-the-shelf systems with little or no requirements for new technology, or on new high-technology designs. Thus a new class of advanced small satellite missions, including autonomously-operating "intelligent" satellites and satellite constellations can be created, opening new fields of application for science and the public. The symposium provided 11 sessions for oral presentations and one poster session. Furthermore, in our 6th Symposium the Student Prize Paper Competition has been continued. The student papers have been evaluated by distinguished judges selected from academia, industry and government, coming from four continents. The finalists presented their papers in the Student Conference session.

The book offers a comprehensive and up-to-date guide to the cutting edge arthroscopic transosseous techniques for the treatment of rotator cuff tears, which are gradually taking over from the common open surgical approach, defined as the gold standard for RCR. With the help of numerous figures, it presents step by step a novel all-arthroscopic anchorless transosseous suture technique that is less invasive and easier to perform. After discussing the etiopathogenesis, histopathology and radiological classification of rotator cuff tears, the book reviews all possible arthroscopic procedures and explores in detail suture management, describing single and double tunnel options. It also examines the complications

and post-operative rehabilitation and imaging, while the closing chapter addresses the economic aspects of daily use. Intended primarily for arthroscopic surgeons interested in the field of shoulder joint repair, this exhaustive guide is also a valuable resource for residents and shoulder specialists. *VW Owners Workshop Manual* Princeton Book Company Publishers

This book presents the state of the art, challenges and future trends in automotive software engineering. The amount of automotive software has grown from just a few lines of code in the 1970s to millions of lines in today's cars. And this trend seems destined to continue in the years to come, considering all the innovations in electric/hybrid, autonomous, and connected cars. Yet there are also concerns related to onboard software, such as security, robustness, and trust. This book covers all essential aspects of the field. After a general introduction to the topic, it addresses automotive software development, automotive software reuse, E/E architectures and safety, C-ITS and security, and future trends. The specific topics discussed include requirements engineering for embedded software systems, tools and methods used in the automotive industry, software product lines, architectural frameworks, various related ISO standards, functional safety and safety cases, cooperative intelligent transportation systems, autonomous vehicles, and security and privacy issues. The intended audience includes researchers from academia who want to learn what the fundamental

challenges are and how they are being tackled in the industry, and practitioners looking for cutting-edge academic findings. Although the book is not written as lecture notes, it can also be used in advanced master's-level courses on software and system engineering. The book also includes a number of case studies that can be used for student projects.
