Killing a Colored Man's Pedigree is a provocative look at why it is neither cool nor an honor to be a "baby mama." As Harrison compellingly argues, it does not take a village to raise a child; it only takes two married parents. This confrontational in-depth look at the numbers documenting the increased poverty and violent crime blacks are experiencing is proof to Michael Harrison that black American's chickens have come home to roost and that black America is reaping what it has sown for decades. Required reading for anyone who wants to understand the problems plaguing the black community, Killing a Colored Man's Pedigree asks questions

and provides answers about issues that are seldom if ever discussed because of political correctness. Things you'll learn: - How the high unmarried birthrate among blacks relates to the poverty and crime that plague large parts of the black community and how, as Harrison argues, it may permanently destroy black culture in America - Clinical and scientific research that explains the importance and presence of the alpha male role model, which is woefully absent for the majority of young blacks - How our culture at large, both black and white, tends to worship "baby mamas" and "bad boy black actors," sports stars, musicians, rappers, and the like and how this utterly exacerbates the problem - How modern culture encourages what Harrison terms a "phony victim status" in the black community (which trickles down into poor white culture), particularly among unwed black mothers - How corrupt black politicians whose personal agendas far outweigh the greater good have taken over black leadership and are leading black America astray - Practical solutions to these problems using education, media, and community outreach programs -

Harrison's dream of starting a national grass roots effort promoting greater personal responsibility, which could reverse this self-destructive trend and lead to a healthier black community and greater prosperity for all Ringing with passion, anecdotes, and a poignant plea for black America to do an all-around better job of behaving itself and raising kids, Harrison ultimately argues for greater responsibility as the answer to the pervasive problems facing the black community.

Clinical Genetics in Nursing Practice Bloomsbury Publishing
As the population in developed countries ages, the health problems associated with aging will become an increasingly important public health concern. While aging is a complex process that takes place over multiple physiological systems, many aspects of aging are under some amount of genetic control. Identification of the loci underpinning these traits could allow for targeting interventions for the most at-risk individuals in old age, improving both lifespan and

quality of life. The Amish represent a uniquely appropriate population for the genetic analysis of aging traits. They live a homogenous lifestyle, with high levels of physical activity throughout their lives. The Amish are descended from a small group of religious separatists from Switzerland, and, by examination of documents and family records, can be placed into a single large pedigree. Gait speed and hand grip strength represent useful measures of physical function in old age. Both are heritable and poor performance on either scale predict incipient mortality. Examination of these traits as continuous measures in the Amish population showed evidence of heritability, but no genome regions showed significant evidence of influence on either trait. The use of gait speed as a continuous trait has the unfortunate side effect of excluding participants too impaired to walk at all. To incorporate these individuals, a dichotomous phenotype of impaired mobility was developed. Linkage analysis of this phenotype resulted in significant evidence of linkage ($LOD > 3$) to chromosomes 3, 15, and 22. Not all domains of aging are as easily or objectively measured as gait speed and hand grip strength. Questions of stamina or fine dexterity are better investigated by self-reported responses to questionnaires. I used individual answers to 19 questions from four scales of physical ability to group individuals using latent class analysis. The optimal fit of the model suggested that there are two latent groups within the Amish dataset, and that the major feature separating the two groups was physical endurance. I was unable to identify evidence of heritability for

latent class membership and genome-wide screens for linkage and association did not identify any candidate loci. Performing genetic analysis in the Amish requires making assumptions that may not reflect the reality of the dataset. I developed an alternative approach to linkage analysis that incorporates the large number of genotypes now available. I use the GERMLINE algorithm to identify regions shared identical-by-descent (IBD) between individuals, and present a score statistic to quantify the configuration of IBD states within a dataset. This method performs analysis in a fraction of the time, and identifies regions shared IBD with high sensitivity. The specificity of this method depends on the pedigree configuration. I present empirical methods of determining statistical significance for arbitrary pedigrees by gene-dropping and resampling based approaches. I demonstrate the performance of this method in two scenarios. As a proof-of-concept, the model is applied to outbred pedigrees of familial essential tremor, a movement disorder that displays an autosomal dominant pattern of inheritance. My method successfully identified a region shared IBD by all affected pedigree members, and excluded as a false positive another region identified by linkage analysis. Application to a successful aging phenotype successfully replicated a locus on chromosome 6 that was identified by conventional linkage analysis and identified another region missed by linkage. The results I present underscore the importance of using observed data to refine the analytic approaches to genetic analysis of aging traits. Beginning

with predefined constructs of aging would miss the importance of endurance in aged individuals in this dataset. Exclusion of individuals from continuous traits would have resulted in missing loci shared by individuals unable to walk. The use of conventional linkage analysis requires the exclusion of the majority of the genotype information, and could result in many false negatives across the genome. Aging is a multifactorial process and any investigation into it must be careful to include all the information present in the data.

An invaluable student-tested study aid, this primer, first published in 2007, provides guided instruction for the analysis and interpretation of genetic principles and practice in problem solving. Each section is introduced with a summary of useful hints for problem solving and an overview of the topic with key terms. A series of problems, generally progressing from simple to more complex, then allows students to test their understanding of the material. Each question and answer is accompanied by detailed explanation. This third edition includes additional problems in basic areas that often challenge students, extended coverage in molecular biology and development, an expanded glossary of terms, and updated historical landmarks. Students at all levels, from beginning biologists and premedical students to graduates seeking a review of basic genetics, will find this book a

valuable aid. It will complement the formal presentation in any genetics textbook or stand alone as a self-paced review manual.

Colorectal cancer is one of the major malignancies affecting westernized societies, both in terms of incidence and as a cause of mortality: it is, however, a preventable and a detectable disease. Although most countries do not actively promote preventive policies for their general population, this trend is gradually changing. In line with this current development, Colorectal Cancer in Clinical Practice examines prevention and early detection of this disease, as well as discussion of management issues. It will provide the clinician with an accessible and up-to-date guide on the primary and secondary prevention of colorectal cancer, and will be of particular interest to primary care physicians and specialists in gastroenterology, oncology and surgery.
