The cohesion and surface tension of water becomes apparent when the drops of

water you add to the penny reach the penny's edge. Once the water has reached the edge, you begin to see a bubble or dome of water forming on top of the penny.

Determination of Copper in a Penny Chemistry 112L Section 001 September 10, 2014 Analysis Questions 1.

Calibration curve is under Observations & Results 2.

Absorbance line equation is $y = 3.0043x$, where y is the absorbance and x is the concentration.

Our penny solution's absorbance is 0.102.

Determination of Copper in a Penny Post Lab ...

Record your predictions in the table of your lab report. Drop water on the penny.

Record how many drops the penny held. Dry the penny and repeat step 2 two more times. Record your findings. Average your three trials for a more accurate idea of how many drops of water a penny will hold. Do not include your prediction in the average.

The dependent variable in this experiment was the number of drops on a penny. #3. Surface tension is what makes water dome on the penny. OR... Water domes on the penny because of surface tension #4. *Drops on a Penny | Experiments | Steve Spangler Science* density of pennies

lab Before 1982, pennies were made of a copper alloy. Since then, they have been made with an outside coating of copper and an inner core of a different metal.

BIOLOGY PENNY LAB - SlideShare

BIOLOGY PENNY LAB 1. PENNY LAB

Introduction: Surface tension refers to water's ability to "stick to itself". Surface tension can be measured and observed by dropping water (drop by drop) onto a penny. The number of water drops that can fit on a penny will

surprise you.
