Capitalism could not exist without the coins, banknotes, documents, information graphics, interfaces, branding, and advertisements made by graphic designers. Even anti-consumerist strategies such as social design and speculative design are appropriated to serve economic growth. It seems design is locked in a cycle of exploitation and extraction, furthering inequality and environmental collapse. CAPS LOCK uses clear language and visual examples to show how graphic design and capitalism are inextricably linked. The book features designed objects and also examines how the study, work, and professional practice of designers support the market economy. Six radical design cooperatives are featured that resist capitalist thinking in their own way, hoping to inspire a more socially aware graphic design.

Some of the finest architectural structures in India are to be found below ground: these are its ancient stepwells. Stepwells are unique to India; the earliest rudimentary wells date from about the 4th century CE, and eventually they were built throughout the country, particularly in the arid western regions. Stepwell construction evolved so that, by the 11th century, they were amazingly complex feats of architecture and engineering, not only providing water all year round but also serving as gathering places, refuges and retreats. The journalist Victoria Lautman first encountered stepwells three decades ago, and this book - now available in paperback for the first time - is a testament to her determined efforts over several years to document these fascinating but largely unknown structures before they disappear. Of the thousands of stepwells that proliferated across India, most were abandoned as a result of modernization and the depletion of water tables. Frequently commissioned by royal or wealthy patrons, the wells vary greatly in scale and design. Some also functioned as subterranean Hindu temples, featuring columned pavilions and elaborate stone carvings. Islamic wells were

generally less flamboyant, but often incorporated shady loggias and small chambers in which to relax and escape the stifling heat. Today, few stepwells are in use. The majority have been left to silt up, fill with rubbish and crumble into disrepair. Gradually, however, the Indian government and heritage organizations are recognizing the need to preserve these architectural wonders. In 2014 India's grandest and best-known stepwell, the Rani ki Vav in Patan, Gujarat, became a UNESCO World Heritage site. In her introduction, Lautman discusses why and where the stepwells were built. She reflects on the reasons they became derelict and considers how the appreciation of stepwells is changing with the work of organizations and individuals who aim to protect and restore them. The main part of the book is arranged in a broadly chronological order, with up to four pages devoted to each of c. 70 stepwells, every one unique in design and engineering. The name, location (including GPS coordinates) and approximate date of each well accompany colour photographs and a concise commentary by Lautman on the history and architecture of the well and her experience of visiting it. While many of the stepwells are rather decrepit, their magnificent engineering and great beauty never fail to impress.

H.L. Hunley Recovery Operations Measured Home Performance This report to the California Energy Commission's Public Interest Energy Research Program (PIER) helps Home Performance Contractors train their crews to achieve superior results in home energy retrofits. The book was updated and expanded in December of 2012 to include the impressive measured results from 15 home energy retrofits in Redding, California that were accomplished using the principles and practices outlined in this report. Homeowners

may also find this information useful, when they want to understand the techniques that regularly achieve utility bill savings of 40 to 70% on an annual basis. This approach-called Measured Home Performance-is different from other means of saving energy. Most importantly, all of the home's energy features are redesigned and improved at the same time, so the synergies take effect immediately. Next, measurements are taken all the way through the process, to ensure that both the redesign and the installation are excellent. Improved comfort and energy savings are assured by high-tech field measurements, taken by the craftspeople themselves rather than by 3rd-party auditors. This process provides real-time feedback to the real decision makers-the technicians who do the work. Measurements of critical parameters like duct air leakage, while-house air leakage, supply air flow at each grill, CO concentration & draft pressure of combustion appliances and superheat and subcooling of the AC equipment make the installation quality-good or poor-are instantly clear to the crews. They can fix any shortcomings on the spot, rather than waiting days or weeks for 3rd-party testing results. Craftspeople measuring key parameters as they work transforms the workplace. Measured quality not only ensures successful results for the homeowners, it self-trains crew members in the field, where they learn more quickly than in the classroom. At the end of every day, workers know when they have achieved excellent results-a powerful motivator that works to everybody's benefit.
