the AMERICAN ACADEMY of PAIN MEDICINE

Textbook on Patient Management ASHP

Chronic pain costs the nation up to \$635 billion each year in medical treatment and lost productivity. The 2010 Patient

Protection and Affordable Care Act required the Department of Health and Human Services

(HHS) to enlist the Institute of Medicine (IOM) in examining pain as a public health

problem. In this report, the IOM offers a blueprint for action in transforming

prevention, care, education, and research, with the goal of providing relief for people

with pain in America. To reach the vast multitude of people with various types of

pain, the nation must adopt a population-level prevention and management strategy.

The IOM recommends that HHS develop a comprehensive plan with specific goals, actions, and timeframes. Better data are

needed to help shape efforts, especially on the groups of people currently

underdiagnosed and undertreated, and the IOM encourages federal and state agencies and

private organizations to accelerate the collection of data on pain incidence, prevalence, and treatments. Because pain

varies from patient to patient, healthcare providers should increasingly aim at tailoring pain care to each person's

experience, and self-management of pain should be promoted. In addition, because there are major gaps in knowledge about pain

across health care and society alike, the IOM recommends that federal agencies and other stakeholders redesign education

programs to bridge these gaps. Pain is a major driver for visits to physicians, a major reason for taking medications, a major cause of disability, and a key factor in

quality of life and productivity. Given the burden of pain in human lives, dollars, and social consequences, relieving pain should be a national priority.

Drug overdose, driven largely by overdose related to the use of opioids, is now the leading cause of unintentional injury death in the United States. The ongoing opioid crisis lies at the intersection of two public health challenges: reducing the burden of suffering from pain and containing the rising toll of the harms that can arise from the use of opioid medications. Chronic pain and opioid use disorder both represent complex human conditions affecting millions of Americans and causing untold disability and loss of function. In the context of the growing opioid problem, the U.S. Food and Drug Administration (FDA) launched an Opioids Action Plan in early 2016. As part of this plan, the FDA asked the National Academies of Sciences, Engineering, and Medicine to convene a committee to update the state of the science on pain research, care, and education and to identify actions the FDA and others can take to respond to the opioid epidemic, with a particular focus on informing FDA's development of a formal method for incorporating individual and societal considerations into its risk-benefit framework for opioid approval and monitoring.

Those who do not feel pain seldom think that it is felt. SAMUEL JOHNSON, *The Rambler*, no. 48 (September 1, 1750) Who among us has not experienced the suffering of a patient with chronic disease, who in addition to the vicissitudes of fatigue, anxiety, and frustration, must also deal with the suffering of pain? Who among us has not considered, and then reconsidered, whether a patient's complaints are worthy of a narcotic and thence worried about the social and legal implications of chronic use? Who among us has not refused pain medications to our patients for fear that use was turning into abuse? Finally, who among us would not have liked a clinical guide to a myriad of syndromes, all of which have pain as their common denominator, in the hopes of developing some strategy to prioritize treatment. Our purpose in preparing *The Pain Management Handbook* is to provide the

information needed by clinicians to develop strategies that optimize pain management. It is the goal of the editors and authors that the present handbook, above all else, will be clinically useful. Its aim is to provide practical information regarding the diagnosis and treatment of disorders causing pain, along with tables and graphics to provide the busy practitioner with rapid access to relevant data.

This Treatment Improvement Protocol (TIP) reviews the use of the three Food and Drug Administration (FDA)-approved medications used to treat opioid use disorder (OUD)—methadone, naltrexone, and buprenorphine—and provides guidance for healthcare professionals and addiction treatment providers on appropriate prescribing practices for these medications and effective strategies for supporting the patients utilizing medication for the treatment of OUD. The goal of treatment for opioid addiction or OUD is remission of the disorder leading to lasting recovery. Recovery is a process of change through which individuals improve their health and wellness, live self-directed lives, and strive to reach their full potential. This TIP also educates patients, families, and the general public about how OUD medications work and the benefits they offer.
