The critical parts of a heavy duty engine are theoretically designed for infinite life without

mechanical fatigue failure. Yet the life of an engine is in reality determined by wear of the critical parts. Even if an engine is designed and built to have normal wear life, abnormal wear takes place either due to special working conditions or increased loading. Understanding abnormal and normal wear enables the engineer to control the external conditions leading to premature wear, or to design the critical parts that have longer wear life and hence lower costs. The literature on wear phenomenon related to engines is scattered in numerous periodicals and books. For the first time, Lakshminarayanan and Nayak bring the tribological aspects of different critical engine

components together in one volume, Component Wear in Heavy Duty covering key components like the Engines is aimed at postgraduates liner, piston, rings, valve, valve in automotive engineering, engine train and bearings, with methods to design, tribology, combustion and identify and quantify wear.
