The GM Diesel Model 1-53X3 is a single-cylinder, two-stroke-cycle engine rated at 30 hp at 3000 rpm. It was developed with both two and four exhaust valve cylinder heads. Variable exhaust and injector cam shaft gears have been added to facilitate changes in timing. The purpose of this investigation was to determine the effects of the variation of exhaust and fuel injection timing on engine performance. A piezoelectric pressure pickup was used to obtain oscilloscope displays of pressure versus crank angle which were photographed. Injection from 20 deg BTC to 5 deg BTC for three exhaust timing configurations have been investigated for each head. Engine performance data under these conditions are presented and discussed. The engine as instrumented lends itself to a variety of student exercises and demonstrations. (Author).

AC Maintenance & Repair Manual for Diesel Engines

The diesel engine is by far the most popular powerplant for boats of all sizes, both power and sail. With the right care and maintenance it is twice as reliable as the petrol engine as it has no electrical ignition system, which in the marine environment can suffer from the effects of damp surroundings. Self-sufficiency at sea and the ability to solve minor engine problems without having to alert the lifeboat is an essential part of good seamanship. Marine Diesel Engines, explains through diagrams and stage-by-stage photographs everything a boat owner needs to know to keep their boat's engine in good order; how to rectify simple faults and how to save a great deal of money on annual service charges. Unlike a workshop

manual that explains no more than how to perform certain tasks, this book offers a detailed, step-by-step guide to essential maintenance procedures whilst explaining exactly why each job is required.
