The reason Peterbilt uses a relay is because Peter uses the : "Power to energise" fan strategy. Which means it should take power to energise the fan solenoid. However, Cat's fan strategy is "Power out is fan off". Take a look at this schematic. I would follow the wires from the fan control solenoid and it should lead you to the relay. The relay is normally inside the frame rail. I got an 01 peterbilt that won't engage the fan hub with ...
The cooling fan relay is the relay that controls the engine ' s cooling fans. When the correct parameters are met, a temperature switch or the computer will activate the relay, which will allow power to the fans. The reason I ask is because if it take power to engage the fan, the truck will have a fan relay that pin 11 connects to. It's a normally closed relay and when pin 11 is sending power, it opens it. If you have this set up, I would suspect the relay that feeds the fan solenoid is faulty. I see this a lot on Peterbilts.
