The reason
Peterbilt uses a
relay is because
Peter uses the
:"Power to

energise" fan
strategy. Which
means it should
take power to
energise the fan
solenoid.
However, Cat's
fan strategy is

"Power out is fan off". Take a look at this schematic. I would follow the wires from the fan control solenoid and it should lead you to the relay. The relay is normally inside the frame rail.

Peterbilt's fan strategy takes 12 volts to the solenoid to turn the fan on. So Pete installs a normally closed relay to the fan control valve. This way when the ECM send out power, it

opens the relay. The relay is normally located on the fire wall of the truck.

It's a normally closed relay and when pin 11 is sending

power, it opens it. If you have this set up, I would suspect the relay that feeds the fan solenoid is faulty. I see this a lot on Peterbilts. *P94-6023, Schematic - 379 Model Family Electrical* The function of the cooling fan relay is to convert a low voltage signal from either the electronic control module (ECM) or a rmostatically controlled sensor. The cooling fan relay takes the low voltage signal and internally

switches the relay to allow battery voltage to be supplied to the radiator cooling fan. I have a 2000 model pete 379 the engine fan runs all the ... The cooling fan relay is the relay that controls the engine's cooling fans. When the correct parameters are met, a temperature switch or the computer will activate the relay, which will allow power to the fans. The

relay will usually be activated once it is detected that the vehicle's temperature approaches excessively high temperatures.

Thanks for the informat ion.It sounds like your fan control relay is sticking.
Peter bilt uses a relay to control the fan. The engine ecm decides to engage the fan but when the ecm decides to cut the fan off, the relay sticks and stays on. When you remove the fuse, the

relay loses all power and cuts off. Please let me know if you need more help or have more questions.
