This aim of this book is to look at the dominant representation that at present underpin the issues of territorial organisation and planning in Europe. Cities and networks are often envisaged as inevitably driving territorial development. However, the conceptualisation of European territorial integration has often been reduced to two conventional models: the centre-periphery model and the hierarchical model of urban networks. Limiting territorial integration to these two schema means that integration is limited. Today, reference to polycentric territorial development has to some extent changed the picture. Rather than being viewed in a polarised, pyramidal manner, spatial dynamics are being read in terms of interconnection and reticulation. In addition, reflection on the subject of polycentric territorial strategies has encouraged politicians and spatial planners to include the principle of "territorial cohesion" in the priorities of European public policies. From considerations which associate conceptual approaches and analytical studies, this book makes it possible to understand in what manner polycentrism, viewed as an alternative to metropolisation,

could sow the seeds for new readings, at various scales, of the organisation of European territory. The main challenge of this book is to explain why it is worthwhile revisiting some rather too static representations of territorial systems in Europe. The aim is to promote the emergence and the consolidation of new, critical ways of looking at the issues of territorial dynamics.

This book describes lessons learned from the implementation of research based learning at Maastricht University. Well-known for its problem based learning (PBL) educational model, Maastricht University implemented research-based learning (RBL) as a new educational concept in addition to PBL, around 2009. The model has taken the shape of an excellence programme offering third-year bachelor students an opportunity to conduct academic research together with academic staff. The introduction of the research-based learning concept into the programmes of all Maastricht University's faculties has resulted in a range of RBL models that vary to fit the various disciplines and programmes offered by the faculties. The book first presents theoretical models and a description of the concepts of research-based learning and undergraduate research (UGR). Next, by means of case studies, it describes the formulas developed to suit the various programmes, the challenges encountered, the initial reservations on the part of the staff, the limitations caused by regulations and demands of the curricula, as well as the successes and results of the excellence programme. The disciplines described in the case studies include psychology and neuroscience, knowledge engineering, social and cultural sciences, law, and business and economics.

Future of Jobs Routledge

There has been an explosion of Web-based courses in higher education. Aiming at an interdisciplinary audience, the contributors draw upon diverse philosophical and empirical backgrounds to make claims about Web-based pedagogy. Among the points they raise is the concern that education is more easily commodified through Internet technologies, implying that traditional faculty roles in teaching (and research) are at risk. Moreover, current understandings of what it means to be a teacher or a student are undergoing

redefinition as a result of these new distance-learning technologies. The contributors note that Web-based pedagogy is associated with sound instruction when particular strategies are adopted. As a corollary, this form of teaching is least effective when attempts are made to directly translate traditional styles of teaching. Political, social, and economic interests are competing to shape the direction that online education will take. The authors argue that opportunities exist for administrators and faculty to define the terms under which Web-based learning will occur in their institutions.
