An automobile, usually called a car (an old word for carriage) or a truck, is a wheeled vehicle that carries its own engine. Older terms include horseless carriage and motor car, with “motor” referring to what is now usually called the engine. It has seats for the driver and, almost without exception, for at least one passenger. The automobile was hailed as an environmental improvement over horses when it was first introduced. Before its introduction, in New York City, over 10,000 tons of manure had to be removed from the streets daily. However, in 2006 the automobile is one of the primary sources of worldwide air pollution and cause of substantial noise and health effects.

Why market research does not work. Available in paperback for the first time, this new updated and revised second edition of Consumer.ology: The Truth About Consumers and the Psychology of Shopping contains a new preface and epilogue, in which Philip Graves reveals the myriad tricks and psychological games high street shops play on consumers; the ways in which we are manipulated into buying things we don't want; the ways in which we deceive ourselves; and the cutting edge behavioural science being used to change our habits to even more significant degrees. Graves, one of the world's leading experts in consumer behavior, reveals why the findings obtained from most market research are completely unreliable. Whether it is company executives seeking to define their corporate strategy or politicians wanting to understand the electorate, the idea that questions answered on a questionnaire or discussed in a focus group can provide useful insights on which to base business decisions is the cause of product failures, political blunders and wasted billions. Using his unique AFECT approach, a set of five criteria to evaluate the reliability of any consumer insight, Graves asserts that it's time for a fresh approach that embraces this new understanding of human behavior.

Ergonomics teaches how to design technology in such a way that it is optimally adapted to the needs, wishes and characteristics of the user. In this context, the concept of the human-machine system has become established. In a systematic way and with a detailed view of the complicated technical and perceptual psychological and methodological connections, this book explains the basics of automotive ergonomics with numerous examples. The application is shown in examples such as package, design of displays and control elements, of environmental ergonomics such as lighting, sound, vibrations, climate and smell. The design of driver assistance systems from an ergonomic perspective is also a central topic. The book is rounded off by methods of ergonomic vehicle development, the use of mock-ups, driving simulators and tests in real vehicles and prototypes. For the first time, those responsible in the automotive industry and in the field of relevant research are provided with a specialized systematic work that provides the ergonomic findings in the design of today's automobiles. This provides planners and designers of today's automobiles with concrete information for ergonomic product development, enabling them to keep an eye on decisive requirements and subsequent customer acceptance. This book is a translation of the original German 1st edition Automobilergonomie by Heiner Bubbb, Klaus Bengler, Rainer E. Grünen & Mark Vollrath, published by Springer Fachmedien Wiesbaden GmbH, part of Springer Nature in 2015. The translation was done with the help of artificial intelligence (machine translation by the service DeepL.com). A subsequent human revision was done primarily in terms of content, so that the book will read stylistically differently from a conventional translation. Springer Nature works continuously to further the development of tools for the production of books and on the related technologies to support the authors.
