Trade policy has played a vital role in the decline of European electronics business. The events that resulted in the disappearance of the European television industry, of a European and Japanese video recorder format and of other European consumer electronics are directly related to market structures in exporting countries and business practices. In this book, factual business data shows and economic models explain how restrictive trade practices result in elimination of efficient competitors in export markets. It deals with the memorable case how a videocassette recorder format was established by dumping and how politics enabled it. An innovative tariff increase for CD players was invalidated by heavy dumping, causing closure of production in Europe. European CTV industry succumbed under permanent dumping and a series of biases – as the interest of a state-owned company – and serious errors making trade instruments void and rules irreconcilable with international agreements. Practical and theoretical examples and explanations, some in detail, of trade rules are provided. The book sketches events – carelessness, prejudice or special interests, arbitrary and false application of trade instruments and fraud – resulting in disappearance of various European electronics business segments.

Currently, the field of information systems technology is rapidly extending into several dimensions. There is the semantic dimension (including object orientation, data deduction and extended knowledge representation schemes), there is improved systems integration, and there are new tools. All these extensions aim to provide semantically richer and better engineered information systems that allow for more adequate and complete representations and thus extend the effective use of database technology to a wider class of applications. Database

researchers and developers, whether they are committed to application or to system construction, are convinced that next-generation information system technology will be heavily determined by a handful of new concepts that they have to understand and work out in detail now. This volume concentrates on the following topics: - Extended data types and data models, database programming languages; - Rule-based data deduction, expert systems, knowledge bases; - Object orientation and semantic data modelling; - DB application development, methodologies and tools; - Interface technology, parallelism, interoperability, ...; - New database applications.

The voices in this collection are primarily those of researchers and developers concerned with bringing knowledge of technological possibilities to bear on informed and effective system design. Their efforts are distinguished from many previous writings on system development by their central and abiding reliance on direct and continuous interaction with those who are the ultimate arbiters of system adequacy; namely, those who will use the technology in their everyday lives and work. A key issue throughout is the question of who does what to whom: whose interests are at stake, who initiates action and for what reason, who defines the problem and who decides that there is one. The papers presented follow in the footsteps of a small but growing international community of scholars and practitioners of participatory systems design. Many of the original European perspectives are represented here as well as some new and distinctively American approaches. The collection is characterized by a rich and diverse set of perspectives and experiences that, despite their differences, share a distinctive spirit and direction -- a more humane, creative, and effective relationship between those involved in technology's design and use, and between technology and the human activities that motivate the technology.

In recent years, many companies have realised customer experience (CX) is the new marketing battle ground. Substantial investments have been made to map customer journeys, identify pain points and improve CX to try and create cut-through. Using real world applications to introduce next generation design tools based on proven concepts from strategy, marketing, psychology and creative problem solving, Lean CX: How to Differentiate at Low Cost and Least Risk discusses how to use Lean Management approaches to innovate your customer experience. This practical book describes how the tools from Lean Management can be applied to the CX innovation problem. The authors draw on hundreds of CX design and strategic innovation projects across a range of industries, both B2B and B2C, from primary research through client work and secondary case studies available in the public domain. The examples include many different vertical industry sectors, including those involving hybrid business models. The cases included share what worked really well and where CX failed. The content goes beyond what actually happened to present an idea of what might be possible with the right design approach and committed resources.

Telecommunications represents one of the largest high technology equipment and service industries in the world. Today there is growing support within the telecommunications industry for competition domestically and in world trade which is directly at odds with its distinctive political tradition of monopoly provision and minimally competitive international trade practices. This raises major questions, both for emerging public policy and for theorists concerned with the making of public policy. This particularly true for Europe, the focus of this study, where the reform of the telecommunications sector has proven one of the most vexing issues confronting the unification of the European Common Market. Noam's book is the first major attempt to address the complicated economic and policy issues of telecommunications in Europe. He provides a thorough discussion of the evolution of central telephone networks, equipment supply, new value-added networks, and new telecommunications-related services within the framework of a detailed country by country analysis. This highly accessible and comprehensive study will be of interest to students and professionals in the areas of communications, economics, and political science.

Through oral history, Falk (sociology, U. of Maryland, College Park) tells the story of those who stayed behind as millions of African Americans left the South in the Great Migration for what they hoped would be a better life in the North. Members of an extended family in the Georgia-South Carolina lowlands talk about schooling, kinship, work, religion, race, and their love of the place where their family has lived for generations. The "conversational ethnography" argues that a link between race and place in the area helps explain African American loyalty to it; for those who stayed put, a numerical majority, deep cultural roots, and longstanding webs of social connection have outweighed racism and economic disadvantages. Our new media landscape of social networking, blogging, and interactivity has forever changed how media content is produced and distributed. Choices about how to gather, evaluate and publish information are ever more complex. This blurring of boundaries between general public values and the values of media professionals has made media ethics an essential issue for media professionals, but also demonstrates how it must be intrinsically part of the wider public conversation. This book teaches students to navigate ethical questions in a digital society and apply ethical concepts and guidelines to their own practice. Using case studies, judgement call boxes and further reading, Understanding Media Ethics clarifies the moral concepts in media contexts, and enables students to apply them to practical decision making through real-life worked examples. Covering key topics such as media freedoms, censorship, privacy, standards, taste, regulation, codes of practice and the ethics of representation, this is an essential guide for students in journalism, media, communication and public relations.
