The phrase "high technology" is perhaps one of the more overused descriptions in our technical vocabulary. It is a phrase generally reserved for discussion of integrated circuits, fiber optics, satellite systems, and computers. Few people would associate high technology with vacuum tubes. The notion that vacuum tube construction is more art than science may have been true 10 or 20 years ago, but today it's a different story. The demand on the part of industry for tubes capable of higher operating power and frequency, and the economic necessity for tubes that provide greater efficiency and reliability, have moved power tube manufacturers into the high-tech arena.

Advancements in tube design and construction have given end users new transmit ters and RF generators that allow industry to grow and prosper. If you bring up the subject of vacuum tubes to someone who has never worked on a transmitter, you are likely to get a blank stare and a question: "Do they make those anymore?" Although receiving tubes have disappeared from the scene, power tubes are alive and well and are performing vital functions in thousands of divergent applications. Solid-state and tube technologies each have their place, each with its strengths and weaknesses. Tube design and development, although accompanied by less fanfare, is advancing as are developments in solid-state technology. Power tubes today are designed with an eye toward high operating efficiency and high gain/bandwidth properties.

The SAM Coup é was an 8-bit British home computer first released in late 1989. Designed to offer backwards compatibility with the ZX Spectrum, it was marketed as a logical upgrade for owners of the much-loved range of Sinclair machines. Originally manufactured by Miles Gordon Technology, the SAM Coup é promised a great deal. Sadly, however, it was not a financial success due to a lack of commercial software and tough competition from the faster 16-bit processors of its rivals. This 30th Anniversary Edition User's Guide features a new foreword from Mel Croucher, the original author. The manual is illustrated throughout by Robin Evans, his memorable creation Sam the Robot always on hand to help users get the most out of their wonder machine. Offered as both a collector's piece and a valuable resource for lucky owners of a SAM Coup é today, we are excited to bring this slice of computing history back to life for the first time in thirty years.

This is the third edition of the Index of Crystallographic Supplies prepared on behalf of the International Union of Crystallography by its Commission on Crystallographic Apparatus. The first was compiled by Professor A. Guinier in 1956 and the second under the editorship of Dr. A. J. Rose in 1959. At that time, it was intended that publication of revised editions of the Index should be a continuing project of succeeding Commissions. However, with changing membership and other pressing activities, the preparation of the third edition has been dependent on the acquisition of a Commission member with appropriate experience and enthusiasm. The Commission is therefore fortunate that Professor R. Rudman, who has had considerable experience in the collation of information on crystallographic matters, has undertaken this task. He has been assisted by the advice of the members of the 1969-72 Commission, in particular that of a group which, during a meeting in Marseille, France, July 4-6, 1971 to discuss Commission affairs, went over the draft of the Index in close detail. These included S. C. Abrahams, U. W. Arndt and D. M. Kheiker. The information included in the Index was gathered from replies to a questionnaire which was sent to a wide range of manufacturers and suppliers throughout the world. It is not intended as complete and exhaustive but it should provide a convenient starting point for the location of the appropriate sources of equipment and materials of use to crystallographers.
