Rowan Ellway is a young college president; Easter Blue, an impassioned student leader. Upon graduation, she takes a fellowship to Africa, and they lose touch. When, decades later, they meet again, they discover that their prior bond was but a rehearsal for the world stage. THE ROWAN TREE reaches from the tumultuous 1960s into humanity's future, encompassing the worlds of politics, sport, ballet, presidential leadership, and world governance. An international cast of characters

personifies the catalytic role of love in political change. Replete with illicit loves, quixotic quests, and inextinguishable hope, THE ROWAN TREE foretells a dignitarian world much as the story of King Arthur and the round table sowed the seeds of democracy.

Knight

(1885-1972) was a central figure—many say the dominant influence—in the development of the "Chicago School of Economics" at the University of Chicago in the 1930s and 1940s, where he taught future Nobel laureates Milton Friedman, James Buchanan, George Stigler, and many other notable scholars. It was Knight's embedded skepticism about the reach of economic knowledge that set the stage for the laissez-faire economics that matured at the University in the 1950s and 1960s. But as important as Knight's technical economic contributions were, he never strayed far from his broad philosophical interests and concern for the state of modern liberal democracy. Ross B. Emmett's selection of Knight's essays is the first to offer a comprehensive picture of the work of this notable social scientist over the span of his career. Included are not only Knight's most influential writings, but also a number of uncollected papers which have not previously been widely accessible. These essays illustrate Knight's views on the central debates regarding economics, social science, ethics, education, and modern liberalism. Volume 1: "What is Truth" in Economics? contains fifteen of Knight's papers up

through 1940. Volume 2: Laissez Faire: Pro and Con includes fourteen of Knight's papers from 1940 through 1967, including "Socialism: The Nature of the Problem" and "The Sickness of Liberal Society." These twenty-nine essays together stand not only as a monument to one of economics' most significant and original thinkers, but will also serve as an invaluable resource for economists, philosophers, and political scientists interested in the development of the western liberal tradition.

The undergraduate years are a turning point in producing scientifically literate citizens and future scientists and engineers. Evidence from research about how students learn science and engineering shows that teaching strategies that motivate and engage students will improve

their learning. So how do students best learn science and engineering? Are there ways of thinking that hinder or help their learning process? Which teaching strategies are most effective in developing their knowledge and skills? And how can practitioners apply these strategies to their own courses or suggest new approaches within their departments or institutions? "Reaching Students" strives to answer these questions. "Reaching Students" presents the best thinking to date on teaching and learning undergraduate science and engineering. Focusing on the disciplines of astronomy, biology, chemistry, engineering, geosciences, and physics, this book is an introduction to strategies to try in your classroom or institution. Concrete examples and case studies illustrate how experienced instructors and leaders have applied evidence-based approaches to address student needs, encouraged the use of effective techniques within a department or an institution, and addressed the challenges that arose along the way. The

research-based strategies in "Reaching Students" can be adopted or adapted by instructors and leaders in all types of public or private higher education institutions. They are designed to work in introductory and upper-level courses, small and large classes, lectures and labs, and courses for majors and non-majors. And these approaches are feasible for practitioners of all experience levels who are open to incorporating ideas from research and reflecting on their teaching practices. This book is an essential resource for enriching instruction and better educating students. Physics for Scientists and Engineers Student Workbook for Physics for Scientists and Engineers This book explores evidence-based practice in college science teaching. It is grounded in disciplinary education research by practicing scientists who have chosen to take Wieman ' s (2014) challenge seriously, and to investigate claims about the efficacy of alternative strategies in college science teaching. In editing this book, we have chosen to showcase outstanding cases of exemplary practice supported by solid evidence, and to include practitioners who offer models of teaching and learning that meet the high standards of the scientific disciplines. Our intention is to let these distinguished

scientists speak for themselves and to offer authentic guidance to those who seek models of excellence. Our primary audience consists of the thousands of dedicated faculty and graduate students who teach undergraduate science at community and technical colleges, 4-year liberal arts institutions, comprehensive regional campuses, and flagship research universities. In keeping with Wieman's challenge, our primary focus has been on identifying classroom practices that encourage and support meaningful learning and conceptual understanding in the natural sciences. The content is structured as follows: after an Introduction based on Constructivist Learning Theory (Section I), the practices we explore are Eliciting Ideas and Encouraging Reflection (Section II); Using Clickers to Engage Students (Section III); Supporting Peer Interaction through Small Group Activities (Section IV); Restructuring Curriculum and Instruction (Section V); Rethinking the Physical Environment (Section VI); Enhancing Understanding with Technology (Section VII), and Assessing Understanding (Section VIII). The book's final section (IX) is devoted to Professional Issues facing college and university

faculty who choose to adopt active learning in their courses. The common feature underlying all of the strategies described in this book is their emphasis on actively engaging students who seek to make sense of natural objects and events. Many of the strategies we highlight emerge from a constructivist view of learning that has gained widespread acceptance in recent years. In this view, learners make sense of the world by forging connections between new ideas and those that are part of their existing knowledge base. For most students, that knowledge base is riddled with a host of naïve notions, misconceptions and alternative conceptions they have acquired throughout their lives. To a considerable extent, the job of the teacher is to coax out these ideas; to help students understand how their ideas differ from the scientifically accepted view; to assist as students restructure and reconcile their newly acquired knowledge; and to provide opportunities for students to evaluate what they have learned and apply it in novel circumstances. Clearly, this prescription demands far more than most college and university scientists have been prepared for. The School World Breton Publishing Company
