The seventh edition of this Blue and Gold Series book brings clarity and context to international law for the seagoing professional. This book is the only work that addresses the international law of the sea from the perspective of the United States. For those who operate on, under and over the sea, international law can sometimes be as complex as it is important. Written by the same former seagoing officer and maritime law professional who authored the current edition of Farwell's Rules of the Nautical Road, this book was designed to bring clarity and context to international law for the seagoing professional. Following an introduction to public international law and a short history of the law of the sea, the book describes the rules that apply in ports and in the adjacent maritime zones, including the territorial sea, exclusive economic zone, archipelagic waters, and the high seas. A highlight of the book are the chapters that focus on subjects of greatest interest to the seagoing professional, including military and intelligence activities in the maritime domain, maritime law enforcement activities and the use of force at sea. The appendices include the text of the 1982 UN Convention on the Law of the Sea and the U.S. Senate's "understandings" of key provisions of the convention. Whether an academy cadet, a midshipman, a seasoned commanding officer, or master mariner, readers of this thorough and timely book will be rewarded with a far greater understanding of the international laws that govern ships and mariners at sea. New in this edition: Over a dozen new cases by courts and arbitration panels interpreting UNCLOS, including the South China Sea dispute between the Philippines and China. Coverage of Commercial Seafarer protections under Maritime Labor Convention. Global Responses to the Mediterranean Migrant Crisis. Coverage of the law protecting our vital submarine cables. Expanded coverage of unmanned and autonomous vessels and aircraft. Coverage on vessel health safety and quarantine measures applicable in the COVID-19 Pandemic. A new chapter surveying issues the U.S. Senate should consider in any decision regarding ratification of UNCLOS. A new appendix setting out the U.S. Navy and Coast Guard policies on sovereign immunity of government vessels and aircraft.

The articles selected for this volume draw on game theory, political science, psychology, sociology and anthropology to consider how the process of dispute resolution is altered, challenged and made more complex by the presence of multiple parties and/or multiple issues. The volume explores issues of coalition formation, defection, collaboration, commitments, voting practices, and joint decision making in settings of increasing human complexity. Also included are examples of concrete uses of deliberative democracy processes taken from new applications of complex dispute resolution theory and practice. The selected essays represent the latest theoretical advances and challenges in the field and demonstrate attempts to use dispute resolution theory in a wide variety of settings such as political decision making and policy formation; regulatory matters; environmental disputes; healthcare; community disputes; constitutional formation; and in many other controversial issues in the polity.

Since the first edition of this book was published early in 1970, three major developments have occurred in the field of x-ray spectrochemical analysis. First, wavelength-dispersive spectrometry, in 1970 already securely established among instrumental analytical methods, has matured. Highly sophisticated, miniaturized, modular, solid-state circuitry has replaced elec tron-tube circuitry in the readout system. Computers are now widely used to program and control fully automated spectrometers and to store, process, and compute analytical concentrations directly and immediately from ac cumulated count data. Matrix effects have largely yielded to mathematical treatment. The problems associated with the ultralong-wavelength region have been largely surmounted. Indirect (association) methods have extended the applicability of x-ray spectrometry to the entire periodic table and even to certain classes of compounds. Modern commercial, computerized, auto matic, simultaneous x-ray spectrometers can index up to 60 specimens in turn into the measurement position and for each collect count data for up to 30 elements and read out the analytical results in 1--4 min-all corrected for absorption-enhancement and particle-size or surface-texture effects and wholly unattended. Sample preparation has long been the time-limiting step

in x-ray spectrochemical analysis. Second, energy-dispersive spectrometry, in 1970 only beginning to assume its place among instrumental analytical methods, has undergone phenomenal development and application and, some believe, may supplant wavelength spectrometry for most applications in the foreseeable future.
