Covering all aspects of sensory panel management, this volume describes the different types of sensory panels (for example panels for quality control, descriptive analysis and discrimination tests), discusses the issues involved with sensory testing, and gives detailed information about sensory panel recruitment, training and on-going management. Sensory Panel Management gives both theoretical and practical information from deciding what type of panel to recruit and

how to conduct panel training, to creating the best sensory team and how to deal with any issues. Downloads of several of the documents included in the book are available from <http://www.laurenlrogers.com/sensory-panel-management.html> The book is divided into three main sections. The first section looks at the recruitment of sensory panels, covering the process from both a scientific and a human resources angle. The second section deals with the training of a sensory panel. Initial training, as well as method and product specific training is covered. Example session plans for running panel sessions for quality control, discrimination tests, descriptive profiling, temporal methods and consumer tests are included within the specific chapters. Refresher and advanced training such as training panelists to take part in gas

chromatography-olfactometry are also included. The third section examines the performance of sensory panels. Chapters within this section explore performance measures and ways of preventing (and dealing with) difficult situations relating to panellists. A final chapter looks at the future of sensory panels. Throughout the book there are short case study examples demonstrating the practical application of the methods being discussed. Sensory Panel Management is a key reference for academics, technical and sensory staff in food companies. Lauren Rogers is an independent sensory science consultant in the UK with more than twenty years of practical experience. She has worked on a wide variety of projects, including shelf life studies, product and flavor optimization, new flavor development and in-depth brand analyses. She is a member of the Society of Sensory Professionals, the Institute of Food Science and Technology's Sensory Science Group, the Sensometric Society and is also a member of the ASTM Sensory Evaluation Committee (E18). Discusses sensory panels for testing food and non-food based products Covers best practices for recruitment, selection and training of panels Provides examples of training plans for sensory panels Encompasses experimental design and data analysis of panel results Organized in modular format for

Neuropathic pain is one of the most common, most debilitating, most costly, and most difficult to treat categories of chronic pain conditions that are characterized by a lesion or disease of the somatosensory nervous system. Managing neuropathic pain is challenging and requires skillful assessment and comprehensive and integrated treatment strategies that are mechanism-guided, evidence-based, and individualized. However, these critical and integral elements are very fragmented in the current literature. The mechanistic understanding of neuropathic pain is typically found in basic research articles. Clinical research evidence is presented in forms of clinical trials with emphasis on minimizing biases such as those from patient selection and assessment. Individualized considerations for each patient are usually presented in case reports and problem-based learning discussions. This book overcomes these barriers and integrates all the critical elements around individual patient care into a coherent management strategy that is practical and applicable to daily clinical practice. Rather than compiling what have been published in the literature, this work emphasizes on identifying and highlighting the key points or findings that guide decision-making in clinical practice. It integrates the key points around a typical case scenario that not only represents the core of the diagnostic and therapeutic processes but also allows introduction and differentiation of painful conditions that bare similarities with the case in hand. The overarching goal is to improve clinical outcomes through better understanding of the mechanisms, more accurate diagnosis, and wiser and more comprehensive treatment strategies.

Headache disorders are among the most common disorders of the nervous system. They are pandemic and, in many cases, they are recurrent and can accompany the patient for the whole life. These disorders impose a substantial burden on headache sufferers, on their families and on society: the individual impact is measured by the frequency and severity of attacks, while the societal burden is measured in terms of loss of activity at work and school as well as of costs for the health system. As a matter of facts, headaches are ranked in the top ten, and maybe the top five, causes of disability worldwide: they are therefore extraordinarily common. Population-based studies have mostly focused on migraine, which, even if it is the most frequently studied headache disorder, is not the most common . Other types of headache, such as the more prevalent TTH and sub-types of the more disabling chronic daily headache, have so far received less attention and need to be better investigated. This book will provide a useful tool to a wide medical population, who is required specific skills to diagnose and manage these frequent and often disabling disorders .Furthermore, it could also represents a compendium for medical students who are usually introduced to this topic through multidisciplinary university

programmes.
