 You're already a smart person, you don't need a 1000+ page book to get you

started on the web's fastest growing programming platform. Instead, 'Learn Python in One Hour' delivers on the promise of code literacy while saving your most precious commodity? time itself. Volkman's innovative programming-by-example approach means you focus on usage, not mindless detail. Based on the author's sold-out live seminars, you'll see Python's flexible coding technique in action as we refactor from script to procedural to object-oriented during actual problem solving. In a twelve-lesson progression, you'll be exposed to this and more: Basic file input and output operations, including

exceptions
Using functions to compute and return multiple values
Basic elements of a class definition and how to call methods
Lists, dictionaries, sets, and other collections
Iteration through collections, files, sorted sets
Searching strings with regular expressions (regex)

Volkman graduated cum laude from Michigan Technological University with a BS in Computer Science in 1986. Since then, he has written for numerous publications, including 'The C Gazette', 'C++ Users Journal', 'Windows Developers Journal', and many others. He has taught college-level programming courses at Washtenaw Community College and has served on its Computer Information Science (CIS) Faculty Advisory Board

for more than a decade. Volkman says Python helped him "rediscover the joy of programming again." www.volkman.org

cake, even though it is typically given the pride of place in expositions in Frege's semantics. As a part of this attempted reversal of emphasis, Jaakko Hintikka has also called attention to the role Frege played in convincing almost everyone that verbs for being had to be treated as multiply ambiguous between the "is" of identity, the "is" of predication, the "is" of existence, and the "is" of

class-inclusion - a view that had been embraced by few major figures (if any) before Frege, with the exception of John Stuart Mill and Augustus De Morgan. Hintikka has gone on to challenge this ambiguity thesis. At the same time, Frege's role in the genesis of another major twentieth-century philosophical movement, the phenomenological one, has become an important issue. Even the translation of Frege's key term "Bedeutung" as "reference" has become controversial. The interpretation of Frege is thus thrown largely back in the melting pot. In editing this volume, we have not tried to publish the last word on Frege. Even though we may harbor such ambitions ourselves, they are not what has led to the present

editorial enterprise. What we have tried to do is to bring together some of the best ongoing work on Frege. Even though the ultimate judgment on our success lies with our readers, we want to register our satisfaction with all the contributions.

integrated solution for security and safety in the home, covering both assistance in health monitoring and safety from strangers/intruders who want to enter the home with harmful intentions. It defines a system whereby recognition of a person/stranger at the door is done using three modules: Face Recognition, Voice Recognition and Similarity Index.

These three modules are taken together to provide a percentage likelihood that the individual is in the "known" or "unknown" category. The system can also continuously monitor the health parameters of a vulnerable person living alone at home and aid them in calling for help in an emergency. The authors have analyzed a number of existing biometric techniques to provide security for an individual living alone at home. These biometric techniques have been tested using MATLAB® image processing and signal processing toolboxes, and results have been calculated on the basis of recognition rate. A major contribution in providing security is a hybrid algorithm proposed by the author named PICA, which combines features of both PCA (Principle Component Analysis) and ICA (Independent Component Analysis) algorithms. This hybrid approach gives better performance recognition than either system alone. The second proposed hybrid algorithm for voice recognition is named as a MFRASTA algorithm by combining features of MFCC (Mel Frequency Cepstral Coefficient) and RASTA-PLP (Relative Spectra-

Perceptual Linear Prediction) algorithm. After performing experiments, results are collected on the basis of recognition rate. The authors have also proposed a third technique named as a Similarity Index to provide trust-based security for an individual. This technique is text independent in which a person is recognized by pronunciation, frequency, tone, pitch, etc., irrespective of the content spoken by the person. By combining these three techniques, a high recognition rate is provided to the person at the door and high security to the individual living independently at home. In the final contribution, the authors have proposed a fingertip-based application for health monitoring by using the concept of sensors. This application is developed using iPhone 6's camera. When a person puts their fingertip on a camera lens, with the help of brightness of the skin, the person's heartbeat will be monitored. This is possible even with a low-quality camera. In case of any emergency, text messages will be sent to the family members of the individual

Feedback control is an important technique that is used in many modern electronic and electromechanical systems. The

successful inclusion of this technique improves performance, reliability and cost effectiveness of many designs. In this series of lectures we introduce the analytical concepts that underlie classical feedback system design. The application of these concepts is illustrated by a variety of

experiments and demonstration systems. The diversity of the demonstration systems reinforces the value of the analytic methods.

Schools, colleges and universities operate along high-tech lines, while alternate forms of online education have emerged to challenge the dominance of

traditional institutions. According to many experts, the rapid digitization of education over the past ten years has undoubtedly been a 'good thing'. Is Technology Good For Education? offers a critical counterpoint to this received wisdom, challenging some of the central ways in which digital technology is presumed to be positively affecting

education. Instead Neil Selwyn considers what is being lost as digital technologies become ever more integral to education provision and engagement. Crucially, he questions the values, agendas and interests that stand to gain most from the rise of digital education. This concise, up-to-the-minute analysis concludes by considering alternate approaches that might

be capable of rescuing and perhaps revitalizing the ideals of public education, while not denying the possibilities of digital technology altogether.

Introducing Mathematics traces the story of mathematics from the ancient world to modern times, describing the great discoveries and providing an accessible introduction to such

topics as number-systems, geometry and algebra, the calculus, the theory of the infinite, statistical reasoning and chaos theory. It shows how the history of mathematics has seen progress and paradox go hand in hand - and how this is still happening today. This is an essential book for anyone interested in the wonderful and weird world of mathematics - which is, after all, the world we have created for ourselves. INNOCENT ABROAD Joseph
