This research monograph utilizes  
exact and Monte Carlo  
permutation statistical methods  
to generate probability values  
and measures of effect size for a  
variety of measures of  
association. Association is  
broadly defined to include  
measures of correlation for two  
interval-level variables, measures  
of association for two nominal-  
level variables or two ordinal-  
level variables, and measures of  
agreement for two nominal-level  
or two ordinal-level variables.  
Additionally, measures of  
association for mixtures of the  
three levels of measurement are  
considered: nominal-ordinal,  
nominal-interval, and ordinal-  
interval measures. Numerous  
comparisons of permutation and  
classical statistical methods are  
presented. Unlike classical  
statistical methods, permutation

statistical methods do not rely on theoretical distributions, avoid the usual assumptions of normality and homogeneity of variance, and depend only on the data at hand. This book takes a unique approach to explaining statistics by integrating a large variety of statistical methods, and establishing the rigor of a topic that to many may seem to be a nascent field. This topic is relatively new in that it took modern computing power to make permutation methods available to those working in mainstream research. Written for a statistically informed audience, it is particularly useful for teachers of statistics, practicing statisticians, applied statisticians, and quantitative graduate students in fields such as psychology, medical research, epidemiology, public health, and biology. It can also serve as a textbook in graduate courses in subjects like statistics, psychology, and biology.

This publication addresses recent developments in neutron generator

(NG) technology. It presents information on compact instruments with high neutron yield to be used for neutron activation analysis (NAA) and prompt gamma neutron activation analysis in combination with high count rate spectrometers.

Traditional NGs have been shown to be effective for applications including borehole logging, homeland security, nuclear medicine and the on-line analysis of aluminium, coal and cement. Pulsed fast thermal neutron analysis, as well as tagged and timed neutron analysis, are additional techniques which can be applied

using NG. Furthermore, NG can effectively be used for elemental analysis and is also effective for analysis of hidden materials by neutron radiography. Useful guidelines for developing NG based research laboratories are also provided in this publication.

Intelligence Testing and Minority Students offers the reader a fresh opportunity to re-learn and re-consider the implications of intelligence testing. Richard R. Valencia and Lisa A. Suzuki discuss the strengths and limitations of IQ testing

relative to the factors which may contribute to biased results. They review the history of the adaptation and adoption of intelligence testing; evaluate the heredity-environment debate; discuss the specific performance factors which apply to IQ testing of those in minority ethnic groups. This practical book offers the practitioner a good sense of what can be done to make testing and education serve the needs of all students fairly and validly, whatever their background.

Continuing his exploration of the organization of complexity and the science of design, this new edition of Herbert Simon's classic work on artificial intelligence adds a chapter that sorts out the current themes and tools—chaos, adaptive systems, genetic algorithms—for analyzing complexity and complex systems. There are updates throughout the book as

well. These take into account important advances in cognitive psychology and the science of design while confirming and extending the book's basic thesis: that a physical symbol system has the necessary and sufficient means for intelligent action. The chapter "Economic Reality" has also been revised to reflect a change in emphasis in Simon's thinking about the respective roles of organizations and markets in economic systems.

The American Experience Elsevier Health Sciences Concepts of Biology is designed for the single-semester introduction to biology course for non-

science majors, which for many students is their only college-level science course. As such, this course represents an important opportunity for students to develop the necessary knowledge, tools, and skills to make informed decisions as they continue with their lives. Rather than being mired down with facts and vocabulary, the typical non-science major student needs information presented in a way that is easy to read and understand. Even more importantly, the content should be meaningful. Students do much better when they understand why biology is relevant to their everyday lives. For these reasons, Concepts of Biology is grounded on an evolutionary basis and includes exciting features

---

that highlight careers in the biological sciences and everyday applications of the concepts at hand. We also strive to show the interconnectedness of topics within this extremely broad discipline. In order to meet the needs of today's instructors and students, we maintain the overall organization and coverage found in most syllabi for this course. A strength of Concepts of Biology is that instructors can customize the book, adapting it to the approach that works best in their classroom. Concepts of Biology also includes an innovative art program that incorporates critical thinking and clicker questions to help students understand--and apply--key concepts.
