This volume offers original essays exploring what 'fictive narrative philosophy' might mean in the research and teaching of philosophy. The first part of the book presents theoretical essays that examine Boylan's recent books: *Teaching Ethics with Three Philosophical Novels* and *Fictive Narrative Philosophy: How Literature can Act as Philosophy*. The second and third part offer essays on how Boylan executes his theory in the practice within his novels from his two series *De Anima* and *Arch*. The book clearly shows the unique aspects of the fictive narrative philosophy approach. First, it makes story-telling accessible to wide audiences. Second, story-telling techniques invoke devices that can set out complicated existential problems to the reader that offer an additional approach to thorny problems through the presentation of lived experience. Third, the discussion of these devices is a way to explore philosophical problems in a way that many can profit from. The book concludes with an essay in which Boylan responds to the critical challenges set out in Part One and the practical criticism set out in Parts Two and Three. Boylan addresses the key claims made by his objectors and defends his position. He engages with the authors in the way his theory is matched against his actual novels. This is useful reading for both philosophers and professors of literature teaching introductory as well as upper-level courses in the fields of philosophy, literature and criticism.

Written by an award-winning historian of science and technology, *Planet in Peril* describes the top four mega-dangers facing humankind – climate change, nukes, pandemics, and artificial intelligence.

It outlines the solutions that have been tried, and analyzes why they have thus far fallen short. These four existential dangers present a special kind of challenge that urgently requires planet-level responses, yet today's international institutions have so far failed to meet this need. The book lays out a realistic pathway for gradually modifying the United Nations over the coming century so that it can become more effective at coordinating global solutions to humanity's problems. Neither optimistic nor pessimistic, but pragmatic and constructive, the book explores how to move past ideological polarization and global political fragmentation. Unafraid to take intellectual risks, *Planet in Peril* sketches a plausible roadmap toward a safer, more democratic future for us all.

For a two-semester course in Calculus for Life Sciences. This text addresses the needs of students in the biological sciences by teaching calculus in a biological context without reducing the course level. It is a calculus text, written so that a math professor without a biology background can teach from it successfully. New concepts are introduced in a three step manner. First, a biological example motivates the topic; second, the topic is then developed via a simple mathematical example; and third the concept is tied to deeper biological examples. This allows students: to see why a concept is important; to understand how to use the concept computationally; to make sure that they can apply the concept.

Effective school leadership depends on developing an understanding of people, organisational learning and organisational processes. However, each school has a unique set of circumstances. Prescriptions for leadership that apply to one school may well not apply to another. *Individual Schools, Unique Solutions* turns away from the highly prescriptive management practices that often fail to provide a workable solution to specific problems in schools. Adrian Raynor demonstrates that by understanding the process influencing any situation, a creative solution can be achieved. The book draws on systems theory and aspects of complexity theory. While addressing many of the issues commonly faced by headteachers, the principles described are equally important for all levels of school management and the book will be of interest to all those in management positions in schools. Ultimately, this book is about developing effective leadership through understanding and is a guide to thinking afresh rather than looking for another quick-fix prescription.

Herbert Simon's classic work on artificial intelligence in the expanded and updated third edition from 1996, with a new introduction by John E. Laird. Herbert Simon's classic and influential *The Sciences of the Artificial* declares definitively that there can be a science not only of natural phenomena but also of what is artificial. Exploring the commonalities of artificial systems, including economic systems, the business firm, artificial intelligence, complex engineering projects, and social plans, Simon argues that designed systems are a valid field of study, and he proposes a science of design. For this third edition, originally published in 1996, Simon added new material that takes into account advances in cognitive psychology and the science of design while confirming and extending the book's basic thesis: that a physical symbol system has the necessary and sufficient means for intelligent action. Simon won the Nobel Prize for Economics in 1978 for his research into the decision-making process within economic organizations and the Turing Award (considered by some the computer science equivalent to the Nobel) with Allen Newell in 1975 for contributions to artificial intelligence, the psychology of human cognition, and list processing. *The Sciences of the Artificial* distills the essence of Simon's thought accessibly and coherently. This reissue of the third edition makes a pioneering work available to a new audience.
