Music both influences and reflects the times in which it was created. In the Middle Ages, the previous Dark Ages, the Crusades, and the feudal system all impacted the types and forms of music in the period. Charlemagne standardized the church mass and promoted the Gregorian chant, to the point of threatening excommunication if any other were performed. Musical notation — the staff line — was developed during the period. The troubadours of France, Meistersingers of Germany, the Cantus Firmus of Italy, and the instruments that played the music are all included in this thorough guide to music of the middle ages. Topics include: the British Isles, Dance Music, Eastern Europe, France, Germanic Lands, Harps, Italy, the Low Countries, Spain, and more.

Managing It All John Benjamins Publishing  
This volume, like the symposium CSP25 which gave rise to it, commemorates the semi-jubilee of Communicating Sequential Processes. 1 Tony Hoare's paper "Communicating Sequential Processes" is today widely regarded as one of the most influential papers in computer science. To commemorate it, an event was organized under the auspices of BCS-FACS (the British Computer Society's Formal Aspects of Computing Science specialist group). CSP25 was one of a series of such events organized to highlight the use of formal methods, emphasize their relevance to modern computing and promote their wider application. BCS-FACS is proud that Tony Hoare presented his original ideas on CSP at one of its first meetings, in 1978. The two-day event, 7-8 July 2004, was hosted by London South Bank University's Institute for Computing Research, Faculty of Business, Computing and Information Management. The intention was to celebrate, reflect upon and look beyond the first quarter-century of CSP's contribution to computer science. The meeting examined the impact of CSP on many areas stretching from semantics (mathematical models for understanding concurrency and communications) and logic (for reasoning about behavior), through the design of parallel programming languages (i/o, parallelism, synchronization and threads) to applications ranging from distributed software and parallel computing to information security, Web services and concurrent hardware circuits. It included a panel discussion with panelists Brookes, Hoare, de Roever and Roscoe (chaired by Je? Sanders), poster presentations by PhD students and others, featured a pre alarm (requiring evacuation in the rain!) and concluded with the presentation of a fountain pen to Prof. Sir C. A. R. Hoare.

The Prentice Hall Guide for College Writers is organized around a sequence of purposes for writing. Each well-structured chapter contains process-oriented advice on choosing a subject, collecting data, drafting and revising essays for each purpose, and advice on customizing major rhetorical strategies to each purpose. Effective student examples, professional essays, and journal exercises help introduce students to the writing process as it changes with each different purpose.

This volume is a collection of papers that highlights some recurring themes that have surfaced in the generative tradition in linguistics over the past 40 years. The volume is more than a historical take on a theoretical tradition; rather, it is also a "compass" pointing to exciting new empirical directions inspired by generative theory. In fact, the papers show a progression from core theoretical concerns to data-driven experimental investigation and can be divided roughly into two categories: those that follow a syntactic and theoretical course, and those that follow an experimental or applied path. Many of the papers revisit long-standing or recurring themes in the generative tradition, some of which seek experimental validation or refutation. The merger of theoretical and experimental concerns makes this volume stand out, but it is also forward looking in that it addresses the recent concerns of the creation and consumption of data across the discipline.

person to prepare illustration copy at a pre-professional level-copy that is, however, often usable for routine purposes-and/or to communicate better with graphics specialists who will prepare the final illustrations. The skills necessary to take the final step of producing finished camera-ready illustrations are, unfortunately, based very much on actual hands-on experience and are thus beyond the ability of this or any other book to instill satisfactory competence in. Illustrations should also prove to be a highly useful reference work for professional illustrators. The wide variety of training and work experiences by which they have acquired their skills may not have provided full acquaintance with all of the exceptionally diverse kinds of information to be found here. There are, moreover, few disciplines whose practitioners cannot profit from an invigorating refresher course. After nearly seven years of work, then, I am pleased to put forward a book with many answers pertaining to the proper selection and preparation of informational illustrations. All such questions and their actual solutions, however, must remain up to you, the inquiring and attentive reader.

The NexGen project, a five year project begun in 1990, is developing successor software packages to the existing family of HEC hydrologic engineering computer programs. The project is being accomplished through a management process that employs teams comprised of technical specialists, computer scientists, and consultants. Modern software engineer methods of requirements analysis, prototype development, field testing, and feedback, are employed. Object-oriented program architecture implemented with C++ and advanced data features of FORTRAN 90 are being used. Prototype models of NexGen software packages in catchment and river analysis are now operational and beta-test versions will be completed at the end of this next year. Final packages are expected to be completed on schedule. The packages will be functional for RISC-chip and Intel-chip based desktop computers. Welcome to IM 2003, the eighth in a series of the premier international technical conference in this field. As IT management has become mission critical to the economies of the developed world, our technical program has grown in relevance, strength and quality. Over the next few years, leading IT organizations will gradually move from identifying infrastructure problems to providing business services via automated, intelligent management systems. To be successful, these future management systems must provide global scalability, for instance, to support Grid computing and large numbers of pervasive devices. In Grid environments, organizations can pool desktops and servers, dynamically creating a virtual environment with huge processing power, and new management challenges. As the number, type, and criticality of devices connected to the Internet grows, new innovative solutions are required to address this unprecedented scale and management complexity. The growing penetration of technologies, such as WLANs, introduces new management challenges, particularly for performance and security. Management systems must also support the management of business

processes and their supporting technology infrastructure as integrated entities. They will need to significantly reduce the amount of adventitious, bootless data thrown at consoles, delivering instead a cogent view of the system state, while leaving the handling of lower level events to self-managed, multifarious systems and devices. There is a new emphasis on "autonomic" computing, building systems that can perform routine tasks without administrator intervention and take prescient actions to rapidly recover from potential software or hardware failures.
