will be more marked if the number of variables per factor is small and the loadings are small. A compromise is to analyze one's data by both procedures so as to ascertain the robustness of the structure to procedural variations (e.g., Goldberg, 1990).

Principles and procedures of exploratory data analysis.

In statistics, exploratory data analysis is an approach to analyzing data sets to summarize their main characteristics, often with visual methods. A statistical model can be used or not, but primarily EDA is for seeing what the data can tell us beyond the formal modeling or hypothesis testing task. Exploratory data analysis was promoted by John Tukey to encourage statisticians to explore the data, and possibly formulate hypotheses that could lead to new data collection and experiments. EDA is di
