Together, the words technology and assessment have different meaning for different people. Those who work with educational or instructional technology take these words to mean assessing the impacts of technology on teaching and learning. Test developers and psychometricians, however, consider ways in which computer-based technologies can be used to enhance current approaches to student assessment. This book examines technology and assessment from both perspectives by examining past, current and promising methodologies and applications in both fields. The influences instructional uses of technology and the increasing reliance on testing to gauge student and school performance have on one another are also explored. The book concludes by describing an organizational structure that could bring instructional applications of technology and assessment practices into closer alignment.

The definitive resource to brain-training for climbing—by an internationally recognized expert As physical as climbing is, it is even more mental. Ultimately, people climb with their minds—hands and feet are merely extensions of their thoughts and will. Becoming a master climber requires that you first master your mind. In *Maximum Climbing*, America's best-selling author on climbing performance presents a climber's guide to the software of the brain—one that will prove invaluable whether one's preference is bouldering, sport climbing, traditional climbing, alpine climbing, or mountaineering. Eric Hörst brings unprecedented clarity to the many cognitive and neurophysical aspects of climbing and dovetails this information into a complete program, setting forth three stages of mental training that correspond to beginner, intermediate, and elite levels of experience and commitment—the ideal template to build upon to personalize one's goals through years of climbing to come.

An antidote to mathematical rigor mortis, teaching how to guess answers without needing a proof or an exact calculation. In problem solving, as in street fighting, rules are for fools: do whatever works—don't just stand there! Yet we often fear an unjustified leap even though it may land us on a correct result. Traditional mathematics teaching is largely about solving exactly stated problems exactly, yet life often hands us partly defined problems needing only moderately accurate solutions. This engaging book is an antidote to the rigor mortis brought on by too much mathematical rigor, teaching us how to guess answers without needing a proof or an exact calculation. In *Street-Fighting Mathematics*, Sanjoy Mahajan builds, sharpens, and demonstrates tools for educated guessing and down-and-dirty, opportunistic problem solving across diverse fields of knowledge—from mathematics to management. Mahajan describes six tools: dimensional analysis, easy cases, lumping, picture proofs, successive approximation, and reasoning by analogy. Illustrating each tool with numerous examples, he carefully separates the tool—the general principle—from the particular application so that the reader can most easily grasp the tool itself to use on problems of particular interest. *Street-Fighting Mathematics* grew out of a short course taught by the author at MIT for students ranging from first-year undergraduates to graduate students ready for careers in physics, mathematics, management, electrical engineering, computer science, and biology. They benefited from an approach that avoided rigor and taught them how to use mathematics to solve real problems. *Street-Fighting Mathematics* will appear in print and online under a Creative Commons Noncommercial Share Alike license.
