While the skills to identify and solve problems are becoming recognised as being increasingly important, there are not many good ways to help you acquire those skills. This book is designed to help you help you acquire those skills so as to be able to deal with undesirable situations, identify the right problem and provide the optimal acceptable solution from the range of prospective solutions. The needed skill for providing acceptable solutions is the ability to think differently to that of your contemporaries. You need to go beyond systems thinking and apply holistic thinking to the matter at hand. This book helps you develop that skill, building on the works of W. Edwards Deming (Quality), Peter Senge (systems thinking), Tom Peters, Peter Drucker and Michael Hammer and James Champy (management) to tell you what to do, how to do it, when to do it, and provide you with the understanding of why it must be done. While systems thinking can help you to understand relationships in situations and think systemically and systematically, systems thinking alone cannot help you provide innovative solutions to complex problems. This is because understanding situations is only the first step on the journey that provides those innovative solutions. This book provides you with frameworks and classifications systemically and systematically starting by discussing thinking, then taking you through thinking about undesirable situations and problems and how to convert them to acceptable solutions. The book is split into three parts: Part I. Thinking and ideas. Part II. Using the ideas in problem-solving. Part III. Innovative solutions to complex problems. Part I provides the thinking and communications tools which are used to create and communicate innovative solutions to complex problems. Chapter 2 introduces you to thinking and introduces some of the tools you can use to assist your creative thinking. Chapter 3 discusses ways to communicate ideas because there is little point in generating ideas if you are not going to do anything with them. Chapter 4 introduces nine Holistic Thinking Perspectives (HTP) as anchor points on the perspectives perimeter and more. Chapter 5: Introduces and provides an overview of critical thinking. Part II covers the problem-solving aspect of creating innovative solutions to complex problems. Chapter 6 introduces Active Brainstorming as a way to increase the numbers of ideas generated by brainstorming using the HTPs coupled with the Kipling questions "who, what, where, when, why and how." Chapter 7 discusses the nature of systems and complex systems. Chapter 8 discusses decision-making because decision-making is at the heart of problem-solving. Chapter 9 discusses problems and solutions, the assumptions behind problem-solving, ways to remedy problems and introduces a holistic approach to managing problems and solutions. Part III provides examples of innovative solutions to complex problems showing how the progressive perspectives went beyond systems thinking and contributed to the innovative solutions and concludes by suggesting things you can do to start to become an innovator. Chapter 10 provides a range of examples of holistic thinking. Each example not only illustrates how the problem-solving process was tailored but provides examples of other aspects of finding innovative solutions to complex problems such as where things went correctly and where and how things can and did go wrong. Chapter 11 provides macro and micro examples of perceiving several issues/systems from various points on the perspectives perimeter for different purposes, the insights obtained and the resulting innovative solutions. Chapter 12 provides suggestions for how you can go about creating your own innovative solutions to complex problems. This book also provides a definitive answer to the question, "what came first, the chicken or the egg?"

Engineering mechanics is one of the fundamental branches of science that is important in the education of professional engineers of any major. Most of the basic engineering courses, such as mechanics of materials, fluid and gas mechanics, machine design, mechatronics, acoustics, vibrations, etc. are based on engineering mechanics courses. In order to absorb the materials of engineering mechanics, it is not enough to consume just theoretical laws and theorems—a student also must develop an ability to solve practical problems. Therefore, it is necessary to solve many problems independently. This book is a part of a four-book series designed to supplement the engineering mechanics courses. This series instructs and applies the principles required to solve practical engineering problems in the following branches of mechanics: statics, kinematics, dynamics, and advanced kinetics. Each book contains between 6 and 8 topics on its specific branch and each topic features 30 problems to be assigned as homework, tests, and/or midterm/final exams with the consent of the instructor. A solution of one similar sample problem from each topic is provided. This first book contains seven topics of statics, the branch of mechanics concerned with the analysis of forces acting on construction systems without an acceleration (a state of the static equilibrium). The book targets the undergraduate students of the sophomore/junior level majoring in science and engineering.

This book brings a fresh new approach to practical problem solving in engineering, covering the critical concepts and ideas that engineers must understand to solve engineering problems. Problem Solving for New Engineers: What Every Engineering Manager Wants You to Know provides strategy and tools needed for new engineers and scientists to become apprentice experimenters armed only with a problem to solve and knowledge of their subject matter. When engineers graduate, they enter the work force with only one part of what 's needed to effectively solve problems -- Problem solving requires not just subject matter expertise but an additional knowledge of strategy. With the combination of both knowledge of subject matter and knowledge of strategy, engineering problems can be attacked efficiently. This book develops strategy for minimizing, eliminating, and finally controlling unwanted variation such that all intentional variation is truly representative of the variables of interest.

This book, with analytical solutions to 260 select problems, is primarily designed for the second year core course on materials science. The treatment of the book reflects the author 's experience of teaching this course comprehensively at IIT-Kanpur for a number of years to the students of engineering and 5-year integrated disciplines. The problems have been categorised into five sections covering a wide range of solid state properties. Section 1 deals with the dual representation of a wave and a particle and then comprehensively explains the behaviour of particles within potential barriers. It provides solutions to the problems that how the energy levels of a free atom lead to the formation of energy bands in solids. The statistics of the distribution of particles in different energy states in a solid has been detailed leading to the derivation of Maxwell – Boltzmann, Bose – Einstein, and Fermi – Dirac statistics and their mutual relationships. Quantitative derivation of the Fermi energy has been obtained by considering free electron energy distribution in solids and then considering Fermi – Dirac distribution as a function of temperature. The derivation of the Richardson 's equation and the related work function has been quantitatively dealt with. The phenomenon of tunnelling has been dealt with in terms of quantum mechanics, whereas the band structure and electronic properties of materials are given quantitative treatment by using Fermi – Dirac distribution function. Section 2 deals with the nature of the chemical bonds, types of bonds and their effect on properties, followed by a detailed presentation of crystal structures of some common materials and a discussion on the structures of C60 and carbon nanotubes. Coordination and packing in crystal structures are considered next followed by a detailed X-ray analysis of simple crystal structures, imperfections in crystals, diffusion, phase equilibria, and mechanical behaviour. Section 3 deals with thermal and electrical properties and their mutual relationships. Calculations of Debye frequency, Debye temperature, and Debye specific heat are presented in great detail. A brief section on superconductivity considers both the conventional and the high – TC superconductors. Sections 4 and 5 deal with the magnetic and dielectric materials, considering magnetic properties from the point of view of the band theory of solids. Crystal structures of some common ferrites are given in detail. Similarly, the displacement characteristics in dielectrics are considered from their charge displacements giving rise to some degree of polarization in the materials.

For the past three decades, nanoscale science and engineering have provided many systems with unique and unprecedented properties, illustrating that these will definitely determine the trajectory of science and technology for years to come. This book is the first textbook to introduce nanoscale systems in a pedagogical, and not research, style. Through ample examples and problems, it emphasizes the difference between bulk and nanoscale systems from a thermodynamic viewpoint and illustrates the process when a bulk system enters the nanoscale domain. It also brings together results of state-of-the-art

research and provides the reader with the scientific foundations of such results. It introduces the fundamental thermodynamic treatment of nanoscale systems as well as the structure, properties, and performance of the three different types of fullerenes, namely, spherical, cylindrical, and planar or graphene. In addition, it discusses 2-D materials systems based on such building blocks. Finally, it shows the thermodynamic criteria allowing nanoscale performance in physically huge systems.
