The 13 years between the publication of the original edition of the handbook and this second edition have been marked by memorable growth in psychotherapy integration. The original classic was the first compilation of the early integrative approaches and was hailed by one reviewer as "the bible of the integration movement." In the interim, psychotherapy integration has

---

grown into a mature, empirically supported, and international movement. This second edition provides a state-of-the-art, comprehensive description of psychotherapy and its clinical practices by leading proponents. In addition to updates of all of the chapters, the new edition features: (1) eight new chapters covering topics such as cognitive-analytic therapy, integrative psychotherapy with culturally diverse clients, cognitive-behavioral analysis system, and blending spirituality with psychotherapy, (2) an entirely new section with two chapters on assimilative integration, (3) updated reviews of the empirical research on integrative and eclectic treatments, (4) chapter guidelines that facilitate comparative analyses and ensure comprehensiveness, and (5) a summary outline to help readers compare the integrative approaches. Blending the best of clinical expertise, empirical research, and theoretical pluralism, the revision of this "integration bible" will prove invaluable to practitioners, researchers, and students alike.

wrestles with a theme that confronts every psychotherapist: the gap between illusions and realities about the professional self. Joyce Slochower closely examines situations in which the therapist's professional and personal wishes collide with the actuality of everyday clinical work. The book unpacks the dynamics of these collisions on both beginning and seasoned therapists, offering ways of sustaining a professional ideal while also exploring the mixed impact of that ideal on clinical work. In examining how illusions and ideals affect the therapeutic encounter for both better and worse, *Psychoanalytic Collisions* invites the reader into the consulting room. This Second Edition has been substantially revised. It includes updated clinical and theoretical material as well as a new chapter about mutual idealizations that coalesce between patient and analyst. Slochower argues that psychoanalytic collisions can be productively engaged, even if they often cannot be fully resolved. The very act of engagement—whether by establishing new grounds for collaboration in the wake of real-world catastrophe, wrestling with clinical impasses that arise from the divergent expectations of analyst and patient, or owning up to and addressing the analyst's "secret delinquencies"—reveals how therapeutic hopefulness can coexist with an acceptance of the analyst's all-too-human fallibility. *Psychoanalytic Collisions* shows how idealization is intrinsic both to forging an analytic identity and practicing across a

---

lifetime. Slochower's work challenges readers to confront their own vulnerabilities and limits while also embracing a professional ideal that is at once human and inspiring. The book is an essential resource for psychoanalysts, psychotherapists, pastoral counselors, and readers interested in the practice of psychotherapy today.

The indispensable reference tool for the groundbreaking science of evolutionary psychology. Why is the mind designed the way it is? How does input from the environment interact with the mind to produce behavior? These are the big, unanswered questions that the field of evolutionary psychology seeks to explore. *The Handbook of Evolutionary Psychology* is the seminal work in this vibrant, quickly-developing new discipline. In this thorough revision and expansion, luminaries in the field provide an in-depth exploration of the foundations of evolutionary psychology and explain the new empirical discoveries and theoretical developments that continue at a breathtaking pace. Evolutionary psychologists posit that the mind has a specialized and complex structure, just as the body has a specialized and complex structure. From this important theoretical concept arises the vast array of possibilities that are at the core of the field, which seeks to examine such traits as perception, language, and memory from an evolutionary perspective. This examination is

intended to determine the human psychological traits that are the products of sexual and natural selection and, as such, to chart and understand human nature. Join the discussion of the big questions addressed by the burgeoning field of evolutionary psychology. Explore the foundations of evolutionary psychology, from theory and methods to the thoughts of EP critics. Discover the psychology of human survival, mating, parenting, cooperation and conflict, culture, and more. Identify how evolutionary psychology is interwoven with other academic subjects and traditional psychological disciplines. *The Handbook of Evolutionary Psychology* is the definitive guide for every psychologist and student interested in keeping abreast of new ideas in this quickly-developing field. *The New Psychology of Leadership: Routledge Thriving in Transitions: A Research-Based Approach to College Student Success* represents a paradigm shift in the student success literature. Grounded in positive psychology, the thriving concept reframes the student success conversation by focusing on the

---

characteristics amenable to change and that promote high levels of academic, interpersonal, and intrapersonal performance in the college environment. The authors contend that a focus on remediating student characteristics or merely encouraging specific behaviors is inadequate to promote success in college and beyond. The collection presents six research studies describing the characteristics that predict thriving in different groups of college students, including first-year students, transfer students, high-risk students, students of color, sophomores, and seniors, and offers recommendations for helping students thrive in college and life.

Civilization from its origins has depended on the food, fibre, and other commodities produced by farmers. In this unique exploration of the world history of agriculture, Mark B. Tauger looks at farmers, farming, and their relationships to non-farmers from the classical societies of the Mediterranean and China through to the twenty-first century. Viewing farmers as the most important human interface between civilization and the natural world, *Agriculture in World History* examines the ways that urban societies have both exploited and

supported farmers, and together have endured the environmental changes and crises that threatened food production. Accessibly written and following a chronological structure, *Agriculture in World History* illuminates these topics through studies of farmers in numerous countries all over the world from Antiquity to the contemporary period. Key themes addressed include the impact of global warming, the role of political and social transformations, and the development of agricultural technology. In particular, the book highlights the complexities of recent decades: increased food production, declining numbers of farmers, and environmental, economic, and political challenges to increasing food production against the demands of a growing population. This wide-ranging survey will be an indispensable text for students of world history, and for anyone interested in the historical development of the present agricultural and food crises.

Winner of the University of San Diego Outstanding Leadership Book Award 2012! Shortlisted for the British Psychological Society Book Award 2011! Shortlisted for the CMI (Chartered Management Institute) Management Book of the Year Award 2011 – 2012! According to John Adair, the most important word in the leader's vocabulary is "we" and the least important word is "I". But if this is true, it raises one important question: why do psychological analyses of leadership always focus on the leader as an individual – as the great "I"? One answer is that theorists and practitioners have never properly understood the psychology of "we-ness". This book fills this gap by presenting a new psychology of leadership that is the result of two decades of research inspired by social identity and self-categorization theories. The book argues that to succeed, leaders need to create, champion, and embed a group

identity in order to cultivate an understanding of 'us' offers an accessible but rigorous introduction to the which they themselves are representative. It also shows how, by doing this, they can make a material difference to the groups, organizations, and societies that they lead. Written in an accessible and engaging style, the book examines a range of central theoretical and practical issues, including the nature of group identity, the basis of authority and legitimacy, the dynamics of justice and fairness, the determinants of followership and charisma, and the practice and politics of leadership. The book will appeal to academics, practitioners and students in social and organizational psychology, sociology, political science and anyone interested in leadership, influence and power.

Aging and Diversity Cambridge University Press  
An accessible yet rigorous and generously illustrated exploration of the computational approach to the study of biological vision. Seeing has puzzled scientists and philosophers for centuries and it continues to do so. This new edition of a classic text

computational approach to understanding biological visual systems. The authors of Seeing, taking as their premise David Marr's statement that "to understand vision by studying only neurons is like trying to understand bird flight by studying only feathers," make use of Marr's three different levels of analysis in the study of vision: the computational level, the algorithmic level, and the hardware implementation level. Each chapter applies this approach to a different topic in vision by examining the problems the visual system encounters in interpreting retinal images and the constraints available to solve these problems; the algorithms that can realize the solution; and the implementation of these algorithms in neurons. Seeing has been thoroughly updated for this edition and expanded to more than three times its original length. It is designed to lead the reader through the problems of vision, from the common (but mistaken) idea that seeing consists just of making pictures in the brain to the minutiae of how neurons collectively encode the

---

visual features that underpin seeing. Although it assumes no prior knowledge of the field, some chapters present advanced material. This makes it the only textbook suitable for both undergraduate and graduate students that takes a consistently computational perspective, offering a firm conceptual basis for tackling the vast literature on vision. It covers a wide range of topics, including aftereffects, the retina, receptive fields, object recognition, brain maps, Bayesian perception, motion, color, and stereopsis. MatLab code is available on the book's website, which includes a simple demonstration of image convolution.
