"Informed by student data, Experience Psychology helps students understand and appreciate psychology as an integrated whole. The personalized, adaptive learning program, thought-provoking examples, and interactive assessments help students see psychology in the world around them and experience it in everyday life. Experience Psychology is about, well, experience-our own behaviors; our relationships at home and in our communities, in school, and at work; and our interactions in different learning environments. Grounded in meaningful real-world contexts, Experience Psychology's contemporary examples, personalized author notes, and applied exercises speak directly to students, allowing them to engage with psychology and to learn verbally, visually,

and experientially-by reading, seeing, and doing. Function is introduced before dysfunction, building student understanding by looking first at typical, everyday behavior before delving into the less common-and likely less personally experienced-rare and abnormal behavior. Experience Psychology places the science of psychology, and the research that helps students see the academic foundations of the discipline, at the forefront of the course. With Experience Psychology, students do not just "take" psychology but actively experience it"--

"Through clever research studies and engaging writing, Dweck illuminates how our beliefs about our capabilities exert tremendous influence on how we learn and which paths we take in life."—Bill Gates, GatesNotes "It's not always the people who start out the smartest who end up the smartest."

After decades of research, world-renowned Stanford University psychologist Carol S. Dweck, Ph.D., discovered a simple but groundbreaking idea: the power of mindset. In this brilliant book, she shows how success in school, work, sports, the arts, and almost every area of human endeavor can be dramatically influenced by how we think about our talents and abilities.

People with a fixed mindset—those who believe that abilities are fixed—are less likely to flourish than those with a growth mindset—those who believe that abilities can be developed. Mindset reveals how great parents, teachers,

managers, and athletes can put this idea to use to foster outstanding accomplishment. In this edition, Dweck offers new insights into her now famous and broadly embraced concept. She introduces a phenomenon she calls false growth mindset and guides people toward adopting a deeper, truer growth mindset. She also expands the mindset concept beyond the individual, applying it to the cultures of groups and organizations. With the right mindset, you can motivate those you lead, teach, and love—to transform their lives and your own.

Introduction to Psychology

Excerpt from book: CHAPTER II The Evidence Of Mind 6. Inferring Mind

from Behavior In the last chapter we saw that some recent writers upon animal behavior and its interpretation, while refusing to admit the presence of consciousness in all forms of animal life, yet hold that it can be proved to exist in certain forms. The latter, it is maintained, display certain peculiarities of behavior that may be regarded as proofs of a psychic accompaniment. Into the nature of these proofs we may now inquire. To begin with, can it be said that when an animal makes a movement in response to a certain stimulus, there is an accompanying consciousness of the stimulus, and that when it fails to move, there is no consciousness ? Is response to stimulation evidence of consciousness ? In the case of man, we know that absence of visible response does not prove that the stimulus has not been sensed; while it is probable that some effect upon motor channels always occurs when consciousness accompanies stimulation, the effect may not be apparent to an outside observer. On the other hand, if movement in

response to the impact of a physical force is evidence of consciousness, then the ball which falls under the influence of gravity and rebounds on striking the floor is conscious. Nor is the case improved if we point out that the movements which animals make in response to stimulation are not the equivalent in energy of the stimulus applied, but involve the setting free of energy stored in the animal as well.

True, when a microscopic animal meets an obstacle in its swimming, and darts backward, the movement is not a mere rebound; it implies energy contributed by the animal's own body. But just so an explosion of gunpowder is not the equivalent in energy of the heat of the match, the stimulus. Similarly it
