The specialized jargon of some sports can be quite esoteric. Non-Americans, for example, are likely puzzled by baseball terms such as bunt, cut-off man, and safety squeeze, while the non-British may pause over cricket's Chinaman, doosra, golden duck, off-break,

popping crease, and yorker. This new dictionary gives the definitions of more than 8,000 terms used in sports and games from around the world, including mainstream sports like basketball and billiards alongside the more obscure netball and snooker. Entries cover sports equipment, strategies, venues, qualifying categories, awards, and administrative bodies, while a comprehensive system of cross-references offers assistance and clarification when needed. An appendix lists standard abbreviations of sports ruling bodies and administrative organizations.

The interna ti ona l symposi a on transcutaneous monitori ng have dea It with the interaction between ideas and research, the introduction of unconventional techniques into clinical practice, and the joint efforts of researchers, clinicians, and industry to design and manufacture practical equipment for noninvasive monitoring. The First International Symposium on Continuous Transcutaneous Blood Gas Monitoring took place in Marburg, West Germany, from May 31 to June 2, 1978.

This was the first major international meeting exclusively devoted to transcutaneous blood gas monitoring, and it was attended by the scientists who had developed this technique or had been working with it, by a large number of doctors, mainly neonatologists who had just begun to use the technique or hoped to do so, and, finally, a rather large number of representatives of industry. The second symposium, with the same title, was held in Zurich, Switzerland, October 14-16, 1981. This time the focus was, to a large extent, on transcutaneous PCO₂ monitoring, for which equipment had become commercially available only a short time before. Fetal monitoring was also discussed at length, as was the use of the transcutaneous techniques in other fields, such as vascular surgery and experimental animal research. The third symposium, October 1-4, 1986, was again held in Zurich. It was entitled "Continuous Transcutaneous Monitoring," indicating that not only blood gases but also other parameters could be monitored transcutaneously.

Anesthesia for Urologic Surgery Public Health Service

This is a concise, up-to-date reference on anesthesia for urological surgery. Urological anesthesia is not recognized as a specialty, and a majority of anesthesiologists and nurse anesthetists will provide anesthesia for these patients. Advances in urological procedures, the advent of treatment of patients with strong anticoagulant and antiplatelet medications, and the demographics of urology patients (many of whom are young or elderly) present challenges for the anesthesiologist and have necessitated changes in anesthesia practice. The last volume on this topic was published in 2000, and the time is right for a fresh presentation of contemporary expertise in anesthesia for urological surgery. The book provides a brief review of renal physiology and pharmacology then addresses anesthesia for each major group of urological procedures (e.g., endoscopic, office-based, laparoscopic and robotic, nephrolithotripsy, renal transplantation, etc.) and in special populations, including the geriatric patient, the pediatric patient, and the pregnant patient. Separate chapters discuss the unique challenges of positioning the patient, and of managing the patient taking anticoagulant and antiplatelet medication, and the
