Quantitative Methods in Supply Chain Management presents some of the most important methods and tools available for modeling and solving problems arising in the context of supply chain management. In the context of this book, "solving problems" usually means designing efficient algorithms for obtaining high-quality solutions. The first chapter is an extensive optimization review covering continuous unconstrained and constrained linear and nonlinear optimization algorithms, as well as dynamic programming and discrete optimization exact methods and heuristics. The second chapter presents time-series forecasting methods together with prediction market techniques for demand forecasting of new products and services. The third chapter details models and algorithms for planning and scheduling with an emphasis on production planning and personnel scheduling. The fourth chapter presents deterministic and stochastic models for inventory control with a detailed analysis on periodic review systems and algorithmic development for optimal control of such systems. The fifth chapter discusses models and algorithms for location/allocation problems arising in supply chain management, and transportation problems arising in distribution management in particular, such as the vehicle routing problem and others. The sixth and final chapter presents a short list of new trends in supply chain management with a discussion of the related challenges that each new trend might bring along in the immediate to near future. Overall, Quantitative Methods in Supply Chain Management may be of particular interest to students and researchers in the fields of supply chain management, operations management, operations research, industrial engineering, and computer science.

Research Paper (postgraduate) from the year 2009 in the subject Business economics - Business Management, Corporate Governance, grade: 68/100, language: English, abstract: Project Management in software development has become extremely complex due to the rapid business changes and technology updates. Triggered by multiple project failures, this report describes adjustment for the existing project management processes followed by FTME to overcome contemporary challenges. FTME is an IT vendor based in Dubai providing IT solutions to multiple customers in the region. The problem identified is the predefined uncalculated constraints; customers impose on vendors as the condition for the project to be awarded. The research drills down in 'Agile' standard process and PMI methodology to recommend appropriate changes in the existing internal processes that will assist in overcoming the constraints. It has analysis of multiple IT vendor experts on the same subject and interview feedback as qualitative analysis to further support the findings. The recommendations include redefining project success criteria to properly assess project failure attributes, appropriate project selection and existing process enhancement using 'Agile' process as a base.

Doctoral Thesis / Dissertation from the year 2015 in the subject Business economics - Business Management, Corporate Governance, grade: A, Swiss Management Center University, language: English, abstract: In the context of the contemporary global business environment, the challenges and the level of competition has increased significantly. The organizational entities within the Swiss financial institutes have been negatively impacted by these challenging factors which have emerged due to the global recession. The purpose of this research is to analyze the level of the ambidexterity present within the Swiss financial industry. The overall research question guiding this study is: What are the factors predicting organizational ambidexterity in the Swiss Financial Industry? This quantitative correlation study utilizes a web-based survey to assess the level of organizational ambidexterity in the Swiss Financial Industry. To address the research question, three empirical models were constructed using partial least squares structural equation modeling (PLS-SEM). The models predicted the levels of organizational ambidexterity in the Swiss financial industry (divided into exploratory innovation and exploitative innovation) using nine independent predictors representing holistic business environment factors highlighting management and productivity issues within the Swiss market. These factors included financial stability, adaptability, leadership, exploration, innovation, exploitation, communication, connectedness, and formalization. The empirical models constructed in this study support the concept of a good fit by predicting that a balance between multiple internal and external market attributes lead to organizational ambidexterity. The results yield that apart from communication the remaining factors defined are good predictors of organizational ambidexterity in Swiss Financial Industry.
