The Science of Psychiatry  
We live in exciting times.

Psychiatrists practicing  
their specialty are beset as  
never before with news of  
developments in the field.

The conduits of news to the  
practicing clinician are  
usually either stories  
written in the popular  
medical press such as news  
circulars and

advertisements from  
commercial concerns, or  
from detailed scientific

articles written for the  
scientific community. In  
both forms, the news has  
been coming thick and fast.  
The problem encountered  
most often by practicing  
psychiatrists and clinicians  
responsible for hospital  
facilities is integrating this  
material into a coherent  
whole, with sufficient  
technical detail to permit  
the appropriate  
development or use of the  
new tests and procedures in  
the clinical setting. The two  
volumes comprising the  
*Handbook of Psychiatric  
Diagnostic Procedures*  
represent an attempt to  
provide a clinically useful

---

review of the current accepted applicability of these tests and procedures, to enable the clinician to properly implement and evaluate the procedures as well as the results obtained.

*Manual for Operational Amplifier Users* Taylor & Francis

This handbook lays out the science behind how animals think, remember, create, calculate, and remember. It provides concise overviews on major areas of study such as animal communication and language, memory

and recall, social cognition, social learning and teaching, numerical and quantitative abilities, as well as innovation and problem solving. The chapters also explore more nuanced topics in greater detail, showing how the research was conducted and how it can be used for further study. The authors range from academics working in renowned university departments to those from research institutions and practitioners in zoos. The

volume encompasses a wide variety of species, ensuring the breadth of the field is explored.

Breast cancer continues to be a major problem. In Volume 1 of this series we dealt exclusively with topics concerned with therapy. In Volume 2 we explored various aspects of experimental biology which are critical to our developing better

---

methods of diagnosis and treatment. In the present volume, we turn to a series of individual topics of considerable interest, including systemic methods for hormonal ablation, screening for early cancer, male breast cancer, and more. The first chapter addresses the question of why some breast tumors metastasize and others do not. Based on elegant animal tumor models, Kim believes that metastasizing tumor cells are the undesirable by product

of the host immune surveillance mechanism. Unstable membrane structures lead to shedding of membrane constituents, abnormal locomotive properties, and evasion of the host defense system. Factors which alter membrane structure will therefore have to be considered in our approach to the management of early breast cancer.

Handbook of Studies

on Depression is a collection of papers on the research and general overview of studies on depression from many countries of the world. Divided into four sections, the handbook presents an international coverage of depression, which is becoming a major worldwide clinical problem. Section I is a collection of studies in classification, phenomenology,

---

etiology of depression, and the classification of depression and response to treatments. The genetic factors contributing to depression, effects on children, and the affective symptoms in non-western countries are described. Section II focuses on studies in the treatment of depression, examining the modes of actions of antidepressants,

the use of electroconvulsive treatment, and psychosurgery for depressive illnesses. Section III moves forward to the research made on depression, including problems in clinical research, the discovery of effective antidepressant and antimanic drugs, and research into clinical psychoendocrinology, particularly on the

function of the adrenal cortex in depression. Concluding this section is a paper on which depression includes a broad spectrum of psychopathology, making biological research more difficult. The last section is a discussion on the aspects of depression. Common topics examined are the management of bereavement; suicide;

---

the side effects of tricyclic antidepressants on cardiac function; and the management of drug over dosage, especially those acts associated with depression. Psychologists, psychiatrists, medical students, school counselors, marriage guidance counselors, select members of the police force, and even parents who are interested in the

subject of depression will find this handbook both useful and informative. Handbook of Stable Strontium Springer Science & Business Media  
Fluorescence is a very powerful tool for work at the frontier of cell biology, photobiology and bioinstrumentation. The stated aim of the workshop was to highlight the

significance of fluorescence work for the understanding of cell and tissue physiology, physiopathology and pharmacology, particularly in terms of the analytical use of fluorescent probes in oncology. In the organization of the workshop a multidisciplinary approach was selected. The

---

purpose of the Advanced Research Workshop (ARW) was to bring together researchers in the various disciplines of tissue optics, imaging, microspectrofluorometry and state of the art probes, in order to explore the full benefits that can be derived in biomedicine through the convergence of these approaches. When applied to in

vivo and in situ studies, fluorescence and related optical methods enable us to explore within tissues, cells and organelles photon effects previously understood only in solution photochemistry. Processes which can be studied at the molecular level by photophysics, photochemistry and physical chemistry

can be evaluated in living tissue by fluorescence spectroscopy and imaging at the intracellular level in terms of structure and function. Thus, fluorescence adds a new dimension to cell biology and physiology. This approach is now supported by a full and versatile, rapidly growing armamentarium of

---

new selective probes needed for the control of the for organelles, enzymes, cations, cytoskeleton and metabolic control.

The Biomedical Engineering

Handbook Springer Science & Business Media

This volume is concerned with the enzymes of the nervous system. Cerebral enzymes form the basis of the functional brain. They are

control of the energetics of the nervous system, whether it be their release or their direction; for the elaboration of transmitters and for their destruction; for the synthesis, transport, and breakdown of all metabolites of the nervous system. They are indispensable for

the control of the multitude of factors that govern our thinking and our behavior. They make it possible for us to comprehend what is taking place around us and perhaps to understand what may be in store for us. Enzymes are the stuff of life, and no living cell can be without them. They are the results of many

---

millions of years of functions of the evolution, from the living cells of time when biological membranes first came into being and were folded to produce the first cells within which the earliest enzymes were wrought. Countless changes have taken place within them, so that, now, only those enzymes exist that play specific roles in the

today. Those in the nervous system possess a multiple role: in the creation, maintenance, and ultimate breakdown of the component cells and in enabling consciousness, perception, memory, and thought to become possible. But though life may go on forever, the

enzymes that make life possible will undergo the many changes involved in the evolutionary process.

Taylor & Francis Calcium antagonists are now regarded as the most important advance in cardiac drug therapy since the advent of beta-adrenergic blocking agents. Acting basically as vasodilators-though with many other complex mechanisms especially in the case of the anti arrhythmic calcium antagonists, these agents have grown in importance to

become among the therapeutic agents of first choice for angina pectoris and hypertension. The major aim of the present book is to present the clinician with the information needed for the practical use of calcium antagonists. What do all the numerous and often conflicting trials say? Do these agents really work? If so, which agent and in what dose? How do the three front runners, verapamil, nifedipine and diltiazem compare in the

efficacy and side-effects with each other? How do the new second generation agents, now entering the North American market, slot in and compare with the three first-liners? When the gloss is taken away from the advertisements, what is really left? The strong clinical bias of the present book should be complimented by further reading of books slanted towards fundamentals. One of the most important and recent of these is that

---

by Dr Winifred Nayler (Calcium Antagonists, Academic Press, 1988). That book should be basic for essential background knowledge in the area of calcium antagonists. The important basic contributions of Fleckenstein deserve emphasis.
