An increasing number of medical specialists are using fluoroscopy outside imaging departments. There has been general neglect of radiological protection coverage of fluoroscopy machines used outside the imaging departments. Lack of radiological protection training of those working with fluoroscopy outside imaging departments can increase the radiation risk to workers and patients. Procedures such as endovascular aneurysm repair (EVAR), renal angioplasty, iliac angioplasty, ureteric stent placement, therapeutic endoscopic retrograde cholangio-pancreatography (ERCP) and bile duct

stenting and drainage have the potential to impart skin doses exceeding 1 Gy. Although tissue reactions among patients and workers from fluoroscopy procedures have so far been reported only in interventional radiology and cardiology, the level of usage of fluoroscopy outside radiology departments creates potential for such injuries.

The surge in COVID-19 cases leading to hospitalizations around the world quickly depleted hospital resources and reserves, forcing physicians to make extremely difficult life-or-death decisions on ventilator allocation between patients. Leaders in academia and industry have developed numerous ventilator support systems using both consumer- and industry-grade hardware to sustain life and to provide intermediate respiratory relief for hospitalized patients. This book is the first of its kind to discuss the respiratory pathophysiology underlying COVID-19, explain ventilator mechanics, provide and evaluate a repository of innovative ventilator support devices conceived amid the pandemic, and explain both hardware and software components necessary to develop an inexpensive ventilator support device. This book serves both as a historical record of the collaborative and innovative response to the anticipated ventilator shortage during the COVID-19 pandemic and as a guide for physicians, engineers, and DIY’ers interested in developing inexpensive transitory ventilator support devices.

Snoring and Obstructive Sleep Apnea Rick Steves

"The importance of sleep for well-being and general and mental health is increasingly being recognized. Sleep complaints are commonly associated with mental disorders and are even part of the diagnostic criteria for some of them, such as mood and anxiety disorders and PTSD. The relationship between sleep and psychiatric disorders is intertwined and, in some cases, bidirectional. Anxiety, psychosis, and depression often result in reduced sleep quality (sleep fragmentation, experience of unpleasant, unrefreshing sleep), quantity (increased or reduced), or pattern (changes in sleep schedule, loss of sleep consistency). Reciprocally, sleep disorders can contribute to the exacerbation of psychiatric symptoms and independently affect the prognosis. Finally, most psychotropic drugs have an effect on sleep and arousal and can aggravate a preexisting sleep abnormality. This book aims to familiarize readers with current knowledge on the mutual effects of sleep and mental health and provide an integrated framework for students, clinicians, and researchers. Throughout its 18 chapters, it discusses the six main categories of sleep disorders: insomnia (Chapters 3-5), hypersomnia (Chapters 6-7), sleep-disordered breathing (Chapters 8-11), circadian disorders (Chapters 12-13), parasomnias (Chapters 14-16), and sleep-related movement disorders (Chapters 17-18)"--
