Environmental Performance Reviews promote sustainable development throughout Europe. They  
present detailed studies on environmental position of each country and examine the framework for  
environmental policy and management.

*Department of Housing and Urban Development--independent agencies  
appropriations for 1986* Springer Science & Business Media  
Long-term environmental effects of chemical exposure have long been of  
concern and, more recently, chemicals which cause changes to the  
sexual development of exposed organisms have been identified. It is  
thought that low-level exposure to a wide range of chemicals may be  
affecting endocrine function, leading to a reduction in fertility and  
an increase in reproductive cancers. Endocrine Disrupting Chemicals  
reviews the scientific evidence and attempts to put the subject into  
context. Along with an overview of the issue, there is discussion of  
the specialised aspects in relation to wildlife; environmental  
oestrogens and male reproduction; and naturally occurring oestrogenic  
substances. With contributions from representatives of the Medical  
Research Council's Institute for Environment and Health and the US  
Environmental Protection Agency, the articles provide a comprehensive  
and detailed review of current issues. This book will be of interest  
to a wide readership, including industrial and environmental  
scientists, managers and policy makers.

In the approach to the analysis of disease, including, of course, cancer, two major thrusts may be  
distinguished. These may be referred to, in shorthand, as agents and processes: the causative  
agents (chemical, microbial, physical, environmental, and psychosocial) and the organismic  
processes, initiated and furthered by the agents, culminating in observable pathology (at the  
macromolecular, cytological, histological, organ function, locomotor, and behavioral levels). The  
past 25 years, since the appearance of the first volume of the predecessor series (1) authored by  
the Editors of this present volume, have seen an impressive number of studies on chemicals (and  
other agents) as etiologic factors in the induction of cancer. The major emphasis has been on the  
discovery of many chemical carcinogens of widely different structures, their metabolism by  
various tissues and cells, and, in turn, their molecular-biochemical effects on the cells. This  
rapidly expanded body of information, as effectively covered in the predecessor volumes, is an  
excellent entree to the second half of the overall problem of chemical carcinogenesis, the  
processes. The active agents trigger a large array of molecular-biochemical alterations to which  
the target cells, target tissues, and target organisms respond in many select and common ways.  
This second major aspect of the induction of cancer by chemicals (and by other agents)- the  
sequence of cellular and tissue changes clearly relevant to cancer-remains the challenge for the  
future.

Progress in Physical Organic Chemistry is dedicated to reviewing the latest  
investigations into organic chemistry that use quantitative and mathematical methods.  
These reviews help readers understand the importance of individual discoveries and  
what they mean to the field as a whole. Moreover, the authors, leading experts in their  
fields, offer unique and thought-provoking perspectives on the current state of the  
science and its future directions. With so many new findings published in a broad range  
of journals, Progress in Physical Organic Chemistry fills the need for a central resource  
that presents, analyzes, and contextualizes the major advances in the field. The articles  
published in Progress in Physical Organic Chemistry are not only of interest to scientists  
working in physical organic chemistry, but also scientists working in the many  
subdisciplines of chemistry in which physical organic chemistry approaches are now  
applied, such as biochemistry, pharmaceutical chemistry, and materials and polymer  
science. Among the topics explored in this series are reaction mechanisms; reactive  
intermediates; combinatorial strategies; novel structures; spectroscopy; chemistry at  
interfaces; stereochemistry; conformational analysis; quantum chemical studies;  
structure-reactivity relationships; solvent, isotope and solid-state effects; long-lived  
charged, sextet or open-shell species; magnetic, non-linear optical and conducting  
molecules; and molecular recognition.

The report begins with an overview outlining the Agency's major priorities. These priorities,  
such as responding to risk, encouraging public involvement, and preventing future  
environmental problems are emphasized throughout the report. The overview is followed by  
chapters on Air, Water, Land, and Toxics. Each chapter is divided into sections that focus on  
the most important environmental issues. This report is largely an update of 3Environmental  
Progress and Challenges: An EPA Perspective<sup>2</sup> (1984). From 1984 to 1988 EPA created new  
programs such as wetlands and marine and estuarine protection.

Volume 16 Reviews In Computational Chemistry Kenny B. Lipkowitz and Donald B. Boyd The focus of  
this book is on methods useful in molecular design. Tutorials and reviews span (1) methods for  
designing compound libraries for combinatorial chemistry and high throughput screening, (2) the  
workings of artificial neural networks and their use in chemistry, (3) force field methods for modeling  
materials and designing new substances, and (4) free energy perturbation methods of practical  
usefulness in ligand design. From Reviews of the Series "This series spans all the subdisciplines in the  
field, from techniques to practical applications, and includes reviews from many of the acknowledged  
leaders in the field. the reviews cross many subdisciplines yet are both general enough to be of wide  
interest while including detailed information of use to workers in particular subdisciplines." -Journal of
