Root Canal Morphology And Its

Commonest root canal morphology of the mesial root was type IV and the distal root was type I. The level of bifurcation of the root canals was commonly observed in the cervical one-third of the root while convergence was observed in the apical one-third in both roots. Prevalence of three rooted mandibular first molars is less than 5%.

Compared to a recent CBCT study by Abella et al. in Spanish population, in maxillary first premolars, the most prevalent root morphology observed was two rooted (51.4%) and most of the teeth exhibited Type IV canal configuration (52.8%), while in maxillary second premolars, the most prevalent root morphology seen was single rooted (82.9%) and most of these teeth exhibited Type I canal configuration (47.2%).

Root canal morphology of first premolarexhibited appreciable diversity. Various root canal configurations of first premolars, including type 2-1-2-1, and the additional canals should deserve full attention. Root canal morphology of first premolarexhibited no differences in terms of the left/right side or sex.

Root Canal Morphology & Access Preparation

Root canal morphology of this tooth varies among population and races. The most common root canal morphology of three-rooted second molar is four canals (MB1, MB2, DB, and P) (Figure 10). The incidence of MB2 ranged from 11.53 to 93.7% [40], in Russia—51.5% [41], and in Portugal—44% [30].

To determine the root canal morphology of human permanent maxillary and mandibular teeth in a Malaysian subpopulation using cone-beam computed tomography (CBCT). A total of 208 CBCT images were examined retrospectively. Prevalence of an extra root/canal and internal morphology based on Vertucci ' s classification were observed in human maxillary and mandibular permanent teeth.

Conical and C-shaped root morphology is very rare (<1 %). The incidence of two canals in the mesio-buccal root is 60 % and one canal to be about 40 %. The incidence of more than one disto-buccal or palatal root is rare (<1 %) [13 - 21]. The majority of maxillary second permanent molars have three roots with four root canals (90 %).

Root canal morphology and its relationship to endodontic ...

This article describes and illustrates tooth morphology and discusses its relationship to endodontic procedures. A thorough understanding of the complexity of the root canal system is essential for understanding the principles and problems of shaping and cleaning, for determining the apical limits and dimensions of canal preparations, and for performing successful microsurgical procedures.
