Network routing is the process of selecting a path across one or more networks. The principles of routing can apply to any type of network, from telephone networks to public transportation. In packet-switching networks, such as the Internet, routing selects the paths for Internet Protocol (IP) packets to travel from their origin to their destination.

Routing In The Internet Of

Routing is the process of selecting a path for traffic in a network or between or across multiple networks. Broadly, routing is performed in many types of networks, including circuit-switched networks, such as the public switched telephone network, and computer networks, such as the Internet. In packet switching networks, routing is the higher-level decision making that directs network packets from their source toward their destination through intermediate network nodes by specific packet forward

Routing, which establishes a communication path from a source IoT device to a destination node, for example, a gateway, is one such challenge. A variety of routing protocols for IoT networks have been studied [5 – 9]. In [5], a routing protocol for low-power and lossy networks (RPL) was proposed.

Routing Security - Internet2

A Router is a networking device that forwards data packets between computer network. This device is usually connected to two or more different networks. When a data packet comes to a router port, the router reads address information in packet to determine out which port the packet will be sent.

Internet routing today is handled through the use of a routing protocol known as BGP (Border Gateway Protocol). Individual networks on the Internet are represented as an autonomous system (AS).

Top 5 Network Routing Protocols Explained

Internet routing is the process of transmitting and routing IP packets over the Internet between two or more nodes. It is the same as standard routing procedures but incorporates packet routing techniques and processes on external networks or those that are hosted or Internet enabled. It utilizes IP-based networks, but mainly those which are publicly accessible such as that of ISPs.

The process of transferring these packets of information from their source node to the destination node with one or more hops in between along the most optimum path is called as ‘ Routing ’ . Routers and switches are the devices that are used for the purpose which work on the routing protocols and algorithms they are configured with. This packets are taken care of by the L3 layer or the network layer of the OSI Reference Model.
