This paper proposes a novel way of formulating priors for estimating economic models. System priors are priors about the model's features and behavior as a system, such as the sacrifice ratio or the maximum duration of response of inflation to a particular shock, for instance. System priors represent a very transparent and economically meaningful way of formulating priors about parameters, without the unintended consequences of independent priors about individual parameters. System priors may complement or also substitute for independent marginal priors. The new philosophy of formulating priors is motivated, explained and illustrated using a structural model for monetary policy.

Steam, and then cumbersome motor, tractors existed in small numbers before 1914, after which the need to produce more foods using less horse and man power saw the origins of the machine we know today. Thanks to mass production, Ford brought the price down to suit average farmers, and in the 1920s to 1940s numerous rivals brought in such novelties as diesel engines, pneumatic tyres, hydraulic implement lifts and even cost-effective all-wheel drive and weather protection. After the Second World-War, a strong new indigenous tractor industry was led by Ferguson, David Brown, Nuffield and Ford. This book highlights these developments and goes on to show the dramatic improvements of the 1950s and 1960s.
