Land Management is normally embedded in a complex legal context, which frequently consists of contradictory objectives, such as: strengthening of rural areas, satisfying the need for affordable living and commercial space, protecting environment and health, supporting transport infrastructure development,

and preserving the landscape. Land management can be understood as a process that comprises coordination of such activities while managing the use and the development of land resources. It can be constrained by the land use specifications resulting from spatial planning process. Along with this, the legal framework often contains generally formulated concepts and open standards, which provide a range of opportunities for realization while balancing the different interests. In this process it is important if and how both constraints and opportunities are recognised by the actors. In this volume this topic is examined from various aspects: first the problems in promoting mutual understanding between researchers and the general public, but also among scientists of different disciplines; second the success requirements of land management instruments as well as unfortunate experience caused by land use changes; third covering land management costs by absorbing value increase and other trade off aspects; and fourth supporting land management by providing geodata with low-cost methods.

An introduction to the  
engineering principles of  
embedded systems, with a  
focus on modeling, design,  
and analysis of cyber-  
physical systems. The most  
visible use of computers  
and software is processing  
information for human  
consumption. The vast  
majority of computers in  
use, however, are much  
less visible. They run the  
engine, brakes, seatbelts,  
airbag, and audio system in  
your car. They digitally  
encode your voice and  
construct a radio signal to  
send it from your cell phone  
to a base station. They

command robots on a factory  
floor, power generation in a  
power plant, processes in a  
chemical plant, and traffic  
lights in a city. These less  
visible computers are called  
embedded systems, and the  
software they run is called  
embedded software. The  
principal challenges in  
designing and analyzing  
embedded systems stem  
from their interaction with  
physical processes. This  
book takes a cyber-physical  
approach to embedded  
systems, introducing the  
engineering concepts  
underlying embedded  
systems as a technology  
and as a subject of study.  
The focus is on modeling,  
design, and analysis of  
cyber-physical systems,  
which integrate computation,  
networking, and physical  
processes. The second  
edition offers two new  
chapters, several new  
exercises, and other  
improvements. The book  
can be used as a textbook at  
the advanced undergraduate  
or introductory graduate  
level and as a professional  
reference for practicing  
engineers and computer  
scientists. Readers should  
have some familiarity with  
machine structures,  
computer programming,  
basic discrete mathematics  
and algorithms, and signals  
and systems.

World-renowned economist Klaus Schwab, Founder and Executive Chairman of the World Economic Forum, explains that we have an opportunity to shape the fourth industrial revolution, which will fundamentally alter how we live and work. Schwab argues that this revolution is different in scale, scope and complexity from any that

have come before. Characterized by a range of new technologies that are fusing the physical, digital and biological worlds, the developments are affecting all disciplines, economies, industries and governments, and even challenging ideas about what it means to be human. Artificial intelligence is already all around us, from supercomputers, drones and virtual assistants to 3D printing, DNA sequencing, smart thermostats, wearable sensors and microchips smaller than a grain of sand. But this is just the beginning: nanomaterials 200 times stronger than steel and a million times thinner than a strand of hair and the first transplant of a 3D printed liver are already in development. Imagine “smart factories” in which global systems of manufacturing are coordinated virtually, or implantable mobile phones made of biosynthetic materials. The fourth industrial revolution, says Schwab, is more significant, and its ramifications more profound, than in any prior

period of human history. He outlines the key technologies driving this revolution and discusses the major impacts expected on government, business, civil society and individuals. Schwab also offers bold ideas on how to harness these changes and shape a better future—one in which technology empowers people rather than replaces them; progress serves society rather than disrupts it; and in which innovators respect moral and ethical boundaries rather than cross them. We all have the opportunity to contribute to developing new frameworks that advance progress.
