Do your students ever struggle to grasp what exactly constitutes evidence or struggle to see how it applies to practice? Would you like them to feel more confident about critiquing evidence? The need for an evidence base for nursing practice is widely accepted. However, what constitutes evidence and how nurses might apply it to practice is not always clear. This book guides nursing students through the process of identifying, appraising and applying evidence in nursing practice. It

explores a wide range differing sources of evidence and knowledge, and helps students to develop key skills of critiquing research and using evidence in clinical decision making.

Diabetes mellitus affects approximately 20
million people in the US, or nearly 7% of the
population. It is expected to increase by 70%
within the next 25 years, and numerous
epidemiologic studies have demonstrated that
type 2 diabetes increases the risk of
cardiovascular morbidity and mortality. It is
estimated to cost over \$92 billion in health care
costs and lost productivity. The increased risk
is due to the detrimental vascular effects of
prolonged exposure to a hyperglycemic,
oxidant-rich environment yielding associated
cardiovascular risk factors: atherosclerosis,
hypertension and clotting abnormalities.
Hypertension and dyslipidemia in diabetic

patients produces substantial decreases in cardiovascular and microvascular diseases. Nutritional and Therapeutic Interventions for Diabetes and Metabolic Syndrome provides an overview of the current epidemic, outlines the consequences of this crisis and lays out strategies to forestall and prevent diabetes, obesity and other intricate issues of metabolic syndrome. The contributing experts from around the world give this book relevant and up-to-date global approaches to the critical consequences of metabolic syndrome and make it an important reference for those working with the treatment, evaluation or public health planning for the effects of metabolic syndrome and diabetes. Scientific discussion of the epidemiology and pathophysiology of the relationship between diabetes and metabolic syndrome Includes coverage of Pre-diabetes

conditions plus both Type I and Type II Diabetes Presents both prevention and treatment options

The American Diabetes Association/JDRF Type 1 Diabetes Sourcebook Christian Liberty Press "Diabetes is a serious, chronic disease that occurs either when the pancreas does not produce enough insulin (a hormone that regulates blood sugar, or glucose), or when the body cannot effectively use the insulin it produces. Diabetes is an important public health problem, one of four priority noncommunicable diseases (NCDs) targeted for action by world leaders. Both the number of cases

and the prevalence of diabetes have been steadily increasing over the past few decades. Globally, an estimated 422 million adults were living with diabetes in 2014, compared to 108 million in 1980. The global prevalence (age-standardized) of diabetes has nearly doubled since 1980, rising from 4.7% to 8.5% in the adult population. This reflects an increase in associated risk factors such as being overweight or obese. Over the past decade, diabetes prevalence has risen faster in low- and middle-income countries than in high-income countries. Diabetes caused 1.5 million deaths in 2012. Higher-than-optimal blood glucose caused an additional 2.2 million deaths, by increasing the risks of cardiovascular and other diseases. Forty-three percent of these 3.7 million deaths occur before the age of 70 years. The percentage of deaths attributable to high blood glucose or diabetes that occurs prior to age 70 is higher in low- and middle-income countries than in high-income countries. Because sophisticated laboratory tests are usually required to distinguish between type 1 diabetes (which requires insulin injections for survival) and type 2 diabetes (where the body cannot properly

use the insulin it produces), separate results, Epidemiologic Research global estimates of diabetes prevalence for type 1 and type 2 do not exist. The majority of people with diabetes are affected by type 2 diabetes. This used to occur nearly entirely among adults, but now occurs in children too."--Page 6.

As the number of patients with diabetes increases annually, it is not surprising that the number of patients with diabetes who are admitted to the hospital also increases. Once in the hospital, patients with diabetes or hyperglycemia may be admitted to the Intensive Care Unit, require urgent or elective surgery, enteral or parenteral nutrition, intravenous insulin infusion, or therapies that significantly impact glycemic control (e.g., steroids). Because many clinical outcomes are influenced by the degree of

glycemic control, knowledge of the best practices in inpatient diabetes management is extremely important. The field of inpatient management of diabetes and hyperglycemia has grown substantially in the last several years. This body of knowledge is summarized in this book, so it can reach the audience of hospitalists, endocrinologists, nurses and other team members who take care of hospitalized patients with diabetes and hyperglycemia.
