While artificial intelligence (AI) simulates human intelligence in machines, machine learning (ML) enables systems to learn from data without explicit programming. In marketing and supply chain management, AI and ML empower businesses to analyze consumer behavior, personalize experiences, optimize advertising strategies, forecast consumer demands, manage inventory, plan routes, and mitigate risks. Businesses can enhance efficiency, accuracy, decision-making, customer engagement, and cost-effectiveness when integrating AI and ML in marketing and supply chain operations. Further research is necessary to drive success in the dynamic marketplace. AI and Machine Learning Applications in Supply Chains and Marketing bridges the gap between theoretical knowledge and practical application of AI and ML in marketing and supply chain management. It examines emerging technologies that can revolutionize industries by transforming business operations. This book covers topics such as data analysis, sustainable development, and blockchain, and is a useful resource for business owners, economists, marketing professionals, engineers, computer scientists, academicians, and researchers.

The significance of business-led corporate responsibility coalitions is indisputable. The WBCSD has 200 member companies with combined annual revenues of US\$7 trillion; the UN Global Compact has almost 8,000 corporate members, over two-thirds of them from developing countries. It is estimated that there are more than 110 national and international generalist business-led CR coalitions. But there is now urgent need for informed and balanced analysis of their achievements, their progress and their potential. Why did these coalitions start and grow? What have been their impacts? Where are they heading now? Where should they be going? What is the future? In a period of austerity, the business and public sector must decide whether funding these coalitions is a priority. To meet current crises, there will have to be a great deal more business involvement; but efforts of individual corporations will not be sufficient. There is also a need for far more collective action among companies and more collaborative action between different sectors of society. Business-led CR coalitions with their decades of conveying experience could play an important role in this process - if they are fit for purpose going forward. Authors David Grayson and Jane Nelson have been actively involved in such coalitions for decades. In Corporate Responsibility Coalitions they first explore

the past, present and future of these coalitions: the emergence of new models of collective corporate action over the past four decades; the current state of play, and the increasing number, diversity and complexity in terms of how they not only network with each other but also engage in a much broader universe of institutions that are promoting responsible business practices. In addition, the book provides in-depth profiles of the most strategic, effective and long-standing coalitions, including: Business for Social Responsibility; Business in the Community; CSR Europe; Instituto Ethos; International Business Leaders Forum; the UN Global Compact; and the WBCSD. This book will be required reading for key supporters and potential partners of such coalitions in companies, governments, international development agencies, foundations, non-governmental organizations, academic institutions and think-tanks. It also aims to inspire a future generation of leaders to be more aware of the role of business as a partner in driving more inclusive, green and responsible growth, and to help them develop new types of leadership skills so that they can be effective in finding multi-stakeholder solutions to complex and systemic challenges.

The spectacular rise of the yen in the mid-1980s has unleashed a new wave of imperialism from Japan. Its origins are traced to a series of crises and rivalries between the two great capitalist powers, Japan and the USA. To escape the high yen, Japanese capital is closing down factories at home and shifting them overseas. Some are going to the advanced countries, but the book's main focus is on the search for cheap labour in Southeast Asia to make parts for Japan's two leading industries: motor vehicles and electronics.

Traditionally, electrical machines are classified into d. c. commutator (brushed) machines, induction (asynchronous) machines and synchronous machines. These three types of electrical machines are still regarded in many academic curricula as fundamental types, despite that d. c. brushed machines (except small machines) have been gradually abandoned and PM brushless machines (PMBM) and switched reluctance machines (SRM) have been in mass production and use for at least two decades. Recently, new topologies of high torque density motors, high speed motors, integrated motor drives and special motors have been developed. Progress in electric machines technology is stimulated by new materials, new areas of applications, impact of power electronics, need for energy saving and new technological challenges. The development of electric machines in the next few years will mostly be stimulated by computer hardware, residential and public applications and transportation systems (land, sea and air). At many Universities teaching and research strategy oriented towards electrical machinery is not up to date and has not been changed in some countries almost since the end of the WWII. In spite of many excellent academic research achievements, the academia - industry collaboration and technology transfer are underestimated or, quite often, neglected. Underestimation of the role of industry, unfamiliarity with new trends and restraint from technology transfer results, with time, in lack of external financial support and drastic decline in the number of students interested in Power Electrical Engineering.
