An overview of emerging topics, theories, methods, and practices in interactive design, with a focus on the multisensory aspects of

sonic experience. Sound is an integral part of every user experience but a neglected medium in design disciplines. Design of an artifact's sonic qualities is often limited to the shaping of functional, representational, and signaling roles of sound. The interdisciplinary field

of sonic interaction design (SID) challenges these prevalent approaches by considering sound as an active medium that can enable novel sensory and social experiences through interactive technologies. This book offers an overview of the emerging SID research, discussing theories, methods, and theoretical considerations with a focus on the multisensory aspects of sonic experience. Sonic Interaction Design gathers contributions from scholars, artists, and designers working at the intersection of fields ranging from electronic music to cognitive science. They offer both theoretical considerations of key themes and case studies of products and systems created for such contexts as mobile music, sensorimotor learning, rehabilitation, and gaming. The goal is not only to extend the existing research and pedagogical approaches to SID but also to foster domains of

ministration/ support Goddard Space Flight Center Extensiye work has been done for many years in the areas of attitude det ermination, attitude prediction, and attitude control. During this time, it has been difficult to obtain reference material that provided a comprehensiv e overview of attitude

support activities. This lack of reference material has made it difficult for those not intimately involved in attitude functions to become acquainted with the ideas and activities which are essential to understandin g the various aspects of spacecraft attitude support. As a result, I

felt the need for a document which could be used by a variety of persons to obtain an understanding of the work which has been done in support of spacecraft attitude objectives. It is believed that this book, prepared by the Computer Sciences Corporation under the able direction of

Dr. James Wertz, provides this type of reference. This book can serve as a reference for individuals involved in mission planning, attitude determination, and attitude dynamics; an introductory textbook for students and professional s starting in this field; an information source for experimen

ters or others involved in spacecraft-related work who need information on spacecraft orientation and how it is determined, but who have neither the time nor the resources to pursue the varied literature on this subject; and a tool for encouraging those who could expand this discipline

to do so, because much remains to be done to satisfy future needs.

Dimensions of Human Behavior

Cambridge University Press

This book outlines the effects that technology-induced change will have on sport within the next five to ten years, and provides food for thought concerning what lies

further ahead. Presented as a collection of essays, the authors are leading academics from renowned institutions such as Massachusetts Institute of Technology, Queensland University of Technology, and the University of Cambridge, and practitioner s with extensive

technological expertise. In their essays, the authors examine the impacts of emerging technologies like artificial intelligence , the Internet of Things, and robotics on sports and assess how they will change sport itself, consumer behavior, and existing business models. The book will help

athletes, entrepreneurs, and innovators working in the sports industry to spot trendsetting technologies, gain deeper insights into how they will affect their activities, and identify the most effective responses to stay ahead of the competition both on and off the pitch.

retains the overall vision and framework that made the previous editions so popular while eliminating outdated

topics and updating information, examples, and case studies. In just 600 pages, accomplished authors Ralph Stair and George Reynolds cover IS principles and their real-world applications using timely, current business examples and hands-on activities. Regardless of their majors,

students can use this book to understand and practice IS principles so they can function more effectively as workers, managers, decision makers, and organizational leaders. Important Notice: Media content referenced within the product description or the product text may not be

available in the ebook version. Byte SAGE This book explores topics that are central to the field of spacecraft attitude determination and control. The authors provide rigorous theoretical derivations of significant algorithms accompanied by a generous amount of qualitative discussions

of the subject matter. The book documents the development of the important concepts and methods in a accessible manner to practicing engineers, graduate-level engineering students and applied mathematicians. It includes detailed examples from actual mission designs to

help ease the transition from theory to practice and also provides prototype algorithms that are readily available on the author's website. Subject matter includes both theoretical derivations and practical implementation of spacecraft attitude determination and control

systems. It provides detailed derivations for attitude kinematics and dynamics and provides detailed description of the most widely used attitude parameterization, the quaternion. This title also provides a thorough treatise of attitude dynamics including Jacobian elliptical functions. It is the

first known book to provide detailed derivations and explanations of state attitude determination and gives readers real-world examples from actual working spacecraft missions. The subject matter is chosen to fill the void of existing textbooks and treatises, especially

in state and dynamics attitude determination. MATLAB code of all examples will be provided through an external website.
