Chemistry: The Molecular Nature of Matter, 8th Edition continues to focus on the intimate relationship between structure at the atomic/molecular level and the observable macroscopic properties of matter. Key revisions focus on three areas: The deliberate inclusion of more, and updated, real-world examples to provide students with a significant relationship of their experiences with the science of chemistry. Simultaneously, examples and questions have been updated to

align them with career concepts relevant to the environmental, engineering, biological, pharmaceutical and medical sciences. Providing students with transferable skills, with a focus on integrating metacognition and three-dimensional learning into the text. When students know what they know they are better able to learn and incorporate the material. Providing a total solution through WileyPLUS with online assessment, answer-specific responses, and additional practice resources. The 8th edition continues to emphasize the importance of applying concepts to problem solving to achieve high-level learning and increase retention of chemistry knowledge. Problems are arranged in a confidence-building order.

you can read more than a million books for free. This is an OCR edition with typos. Excerpt from book: cation of substances. The quantity of a given substance which a definite quantity, say one hundred grams, of a given solvent can dissolve is limited, and is dependent on temperature, and, in the case of gases, on pressure also; but for a definite temperature (and pressure) the quantity is definite. The solubility of solids generally increases with increase of temperature, but in some instances it decreases. The solubility of gases diminishes with increase of temperature, and it increases with increase of pressure. A solvent, when it has dissolved the maximum of a given substance, is said to be saturated. Unsaturated solutions of solid or non-volatile substances may be concentrated by evaporating the solvent (see Exp. 21/4), and the solute may be recovered, often unchanged, by making the evaporation complete (see Exps. 17/ib and 18/A). Crystallization. If saturated or nearly saturated solutions remain undisturbed, so that slow cooling and evaporation may take place, the solid in many instances separates in definite geometric forms, as you saw in your own experiments with alum and copper sulphate. This is crystallization. It may accompany solidification, not only from the state of solution, but also of fusion (seen in the sulphur experiments, Nos. 11 and 12, and 12/j), and even from the gaseous condition (seen in the experiment with iodine, No. 20/j, the sublimate of which is beautifully crystalline). In the crystallization of mixtures each individual substance crystallizes by itself, in its own peculiar form, and therefore crystallization is a most important means of separation and purification. Furthermore, the peculiarities of form—that is, the shape and disposition of the faces, the dimension of the angles,

etc.?are definite and constant characteristics of the substanc...
