"Blue Pelican Java"
is a somewhat
unusual high school
computer science
textbook. Most
computer science
texts will begin
with a section on
the history of
computers followed
with a flurry of

definitions that are
just "so many words"
to the average
student. The approach
here is to first give
the student some
experience upon which
to hang the
definitions that come
later. The usual
practice of
introducing classes
and objects is
deferred until the
student has a firm
grasp of the
fundamentals (loops,
decision structures,
etc). Thus, the
beginning student is
not overwhelmed by
the simultaneous
introduction of OOPs
and the fundamentals.
The book includes
plenty of exercises
(many in "contest"
form), programming
projects, and a huge
appendix.

Many teens today who use the Internet are actively involved in participatory cultures—joining online communities (Facebook, message boards, game clans), producing creative work in new forms (digital sampling, modding, fan videomaking, fan fiction), working in teams to complete tasks and develop new knowledge (as in Wikipedia), and shaping the flow of media (as in blogging or podcasting). A growing body of scholarship suggests potential benefits of these activities, including opportunities for peer-to-peer learning, development of skills useful in the modern workplace, and a more empowered conception of citizenship. Some argue that young people pick up these key skills and competencies on their own by interacting with popular culture; but the problems of unequal access, lack of media transparency, and the

breakdown of traditional forms of socialization and professional training suggest a role for policy and pedagogical intervention.

This report aims to shift the conversation about the "digital divide" from questions about access to technology to questions about access to opportunities for involvement in participatory culture and how to provide all young people with the chance to develop the cultural competencies and social skills needed. Fostering these skills, the authors argue, requires a systemic approach to media education; schools, afterschool programs, and parents all have distinctive roles to play. A History of Greek Art

Springer Science &

Business Media

This book documents the

state of the art in the use of remote sensing to address time-sensitive information requirements.

Specifically, it brings together a group of authors who are both researchers and practitioners, who work toward or are currently using remote sensing to address time-sensitive information requirements with the goal of advancing the effective use of remote sensing to supply time-sensitive information.

The book addresses the theoretical implications of time-sensitivity on the remote sensing process, assessments or descriptions of methods for expediting the delivery and improving the quality of information derived from remote sensing, and describes and analyzes

time-sensitive remote sensing applications, with an emphasis on lessons learned. This book is intended for remote sensing scientists, practitioners (e.g., emergency responders or administrators of emergency response agencies), and students, but will also be of use to those seeking to understand the potential of remote sensing to address a range of pressing issues, particularly natural and anthropogenic hazard response.

iPod: The Missing Manual
Springer Nature
An Indigenous environmental scientist breaks down why western conservationism isn't working--and offers Indigenous models informed by case studies, personal stories, and family histories that center the voices of Latin American women and land protectors. Despite the undeniable fact that Indigenous communities are among the most affected by climate devastation, Indigenous science is nowhere to be found in mainstream environmental policy or discourse. And while holistic land, water, and forest management practices born from millennia of Indigenous knowledge systems have much to teach all of us, Indigenous science has long been ignored,

otherized, or perceived as "soft"--the product of a systematic, centuries-long campaign of racism, colonialism, extractive capitalism, and delegitimization. Here, Jessica Hernandez--Maya Ch'orti' and Zapotec environmental scientist and founder of environmental agency Piña Soul--introduces and contextualizes Indigenous environmental knowledge and proposes a vision of land stewardship that heals rather than displaces, that generates rather than destroys. She breaks down the failures of western-defined conservatism and shares alternatives, citing the restoration work of urban Indigenous people in Seattle; her family's fight against ecoterrorism in Latin America; and holistic land management approaches of Indigenous groups across

the continent. Through case studies, historical overviews, and stories that center the voices and lived experiences of Indigenous Latin American women and land protectors, Hernandez makes the case that if we're to recover the health of our planet--for everyone--we need to stop the eco-colonialism ravaging Indigenous lands and restore our relationship with Earth to one of harmony and respect.

"Fundamentals of Computer Programming with C#" is a

comprehensive computer programming tutorial that teaches programming, logical thinking, data structures and algorithms, problem solving and high quality code with lots of examples in C#. It starts with the first steps in programming and software development like variables, data types, conditional statements, loops and arrays and continues with other basic topics like methods, numeral systems, strings and string processing, exceptions, classes and objects. After

the basics this fundamental programming book enters into more advanced programming topics like recursion, data structures (lists, trees, hash-tables and graphs), high-quality code, unit testing and refactoring, object-oriented principles (inheritance, abstraction, encapsulation and polymorphism) and their implementation the C# language. It also covers fundamental topics that each good developer should know like algorithm design, complexity of algorithms and problem solving. The book uses C# language and Visual Studio to illustrate the programming concepts and explains some C# / .NET specific technologies like lambda expressions, extension methods and LINQ. The book is written by a team of developers lead by Svetlin Nakov who has 20+ years practical software

development experience. It teaches the major programming concepts and way of thinking needed to become a good software engineer and the C# language in the meantime. It is a great start for anyone who wants to become a skillful software engineer. The books does not teach technologies like databases, mobile and web development, but shows the true way to master the basics of programming regardless of the languages, technologies and tools. It is good for beginners and intermediate developers who want to put a solid base for a successful career in the software engineering industry. The book is accompanied by free video lessons, presentation slides and mind maps, as well as hundreds of exercises and live examples.
