This report considers the biological and behavioral mechanisms that may underlie the pathogenicity of tobacco smoke. Many Surgeon General's reports have considered research findings on mechanisms in assessing the biological plausibility of associations observed in epidemiologic studies. Mechanisms of disease are important because they may provide plausibility, which is one of the guideline criteria for assessing evidence on causation. This report specifically reviews the evidence on the potential mechanisms by which smoking causes diseases and considers whether a

mechanism is likely to be operative in the production of human disease by tobacco smoke. This evidence is relevant to understanding how smoking causes disease, to identifying those who may be particularly susceptible, and to assessing the potential risks of tobacco products.

This book established itself in its first edition as the definitive 'one-stop-shop' revision aid; the only one available to encompass all elements of the MRCOG Part 2 examination in a single volume. Now incorporating practice EMQs as well as the standard question types, this second edition will ensure that it retains its place on the 'must-have' list for every candidate preparing for this exam. Concentrating on testing the candidate's theoretical and practical knowledge as recommended in the current MRCOG syllabus, the book tests the trainee with questions in obstetrics and gynaecology and those aspects of medicine, surgery and paediatrics relevant to the practice of both. The book is divided into four key parts, one for each style of question, each of which opens with an introductory section on how to approach the exam and, crucially, how to fail it. # Part 1 provides a series of short answer practice papers. Common mistakes are

highlighted as well as a list of key points required to get full marks. A sample answer is given for each question # Part 2 contains a mock paper for the MCQ part of the exam, containing 225 questions with answers and helpful annotations # Part 3 introduces the EMQ, giving the reader 40 questions in the style of the examination, together with answers and explanatory notes # Part 4 is devoted to the OSCE, with descriptions of 20 sample stations assessing different aspects of clinical practice, advice on how to tackle these, and suggested marking schemes. Throughout, questions have been designed to test factual knowledge and understanding, problem-solving ability, and clinical and communication skills.
Schwartz' Principles of Surgery: Self-Assessment and Board Review, Eighth Edition McGraw Hill Professional
Among the standard oncology modalities, surgical oncology is singular in that it lacks a separate board certification or even an added qualification mechanism. 'Card-carrying' surgical oncologists are certified by the American Board of Surgery, as are all other general surgeons. What distinguishes the surgical oncologist is a set of cognitive skills rather than a specific armamentarium of surgical techniques. This different conceptual

framework is derived from extensive additional training that leads to an in-depth understanding of the natural history and biologic behavior of the various solid tumor systems. Equipped with this perspective, the surgical oncologist is particularly well positioned to integrate the various available therapeutic modalities into a coherent care program for the solid tumor patient. As a central theme, the chapters of this book demonstrate that increasingly sophisticated diagnostic and staging approaches are helping to move chemo therapy and radiotherapy into the preoperative neoadjuvant setting. This fundamental alteration is based on the awareness that even early-stage solid tumor disease is frequently systemic at the time of presentation, at least on a subclinical level. And although the primary tumor may be controllable by surgery with radiotherapy, the uncontrolled (and initially clinically unapparent) distant disease ultimately determines patient survival. The other perspective driving the neoadjuvant approach is an emerging awareness that for most solid tumor systems, neoadjuvant treatment responses can facilitate less mutilating surgery with comparable levels of local

disease control.
