?This monograph poses a series of key problems of evidential reasoning and argumentation. It then offers solutions achieved by applying recently developed computational models of argumentation made available in artificial intelligence. Each problem is posed in such a way that the solution is easily understood. The book progresses from confronting these problems and offering solutions to them, building a useful general method for evaluating arguments along the way. It provides a hands-on survey explaining to the reader how to use current argumentation methods and concepts that are increasingly being implemented in more precise ways for the application of software tools in computational argumentation systems. It shows how the use of these tools and methods requires a new approach to the concepts of knowledge and explanation suitable for diverse settings, such as issues of public safety and health, debate, legal argumentation, forensic evidence, science education, and the use of expert opinion evidence in personal and public deliberations.

Mature sciences have been long been characterized in terms of the "successfulness", "reliability" or "trustworthiness" of their theoretical, experimental or technical accomplishments. Today many philosophers of science talk of "robustness", often without specifying in a precise way the meaning of this term. This lack of clarity is the cause of frequent misunderstandings, since all these notions, and that of robustness in particular, are connected to fundamental issues, which concern nothing less than the very nature of science and its specificity with respect to other human practices, the nature of rationality and of scientific progress; and science's claim to be a truth-conducive activity. This book offers for the first time a comprehensive analysis of the problem of robustness, and in general, that of the reliability of science, based on several detailed case studies and on philosophical essays inspired by the so-called practical turn in philosophy of science. The National Children's Study (NCS) is planned to be the largest long-term study of environmental and genetic effects on children's

health ever conducted in the United States. It proposes to examine the effects of environmental influences on the health and development of approximately 100,000 children across the United States, following them from before birth until age 21. By archiving all of the data collected, the NCS is intended to provide a valuable resource for analyses conducted many years into the future. This book evaluates the research plan for the NCS, by assessing the scientific rigor of the study and the extent to which it is being carried out with methods, measures, and collection of data and specimens to maximize the scientific yield of the study. The book concludes that if the NCS is conducted as proposed, the database derived from the study should be valuable for investigating hypotheses described in the research plan as well as additional hypotheses that will evolve. Nevertheless, there are important weaknesses and shortcomings in the research plan that diminish the study's expected value below what it might be.

Essentials of Scientific Writing: How to Write Effective Titles and Abstracts for Research Papers and Proposals is a belated entrant into a vast and crucially important area with scarce reference materials. This scarcity manifested itself as I searched what I had expected would be useful source materials for the present book. I skimmed through many textbooks on scientific writing and editing, articles on the Internet, and notes from courses on scientific writing. They all turned out to be manifestly wanting in both depth and scope. None extended beyond two pages, and most were hardly a page long, so they were largely useless for my purposes. To the authors' knowledge, few published books treat the subjects of Titles and Abstracts in the kind of detail presented in this book. Accordingly, in developing the book, the author hoped to fill a void in the crucial area of facilitating sharing of knowledge and information from research work. It is my hope that everyone writing scientific work will endeavor to find space for the book on their shelves and will place it within arms length whenever they are writing or editing the title or abstract.

Aware of the significant potential of nascent biotechnologies, the European Economic Community (the predecessor to the European Union) was one of the first regions in the world to develop a regulatory framework for them. Back in the 1980s, the objective of Community member countries was to strengthen the standards of consensus and collaboration, and of environmental and health safety, as well as to promote an industrial sector of enormous potential. In spite of all effort, towards the end of the 1990s it was a widely accepted fact that a number of political and economic factors were blocking the development of biotechnology in Europe. From that crisis emerged what in some aspects is probably the most comprehensive and rigorous body of regulations for biotechnology in the world today. However, the very high technical level of those regulations did not prevent a new crisis which EU institutions aim to solve with a new regulatory framework. Thus, since March 2015, the way towards the third regulatory framework for Biotechnology in the EU has been open. Will this third regulatory framework finally offer sufficient guarantees to allow a healthy and sustainable development of biotechnology in the EU? What do we need to do so that 'third time is lucky'? In this work, a group of European and non-European experts, from different disciplines and approaches, discuss the past and the present, as well as the various possible futures, of Genetically Modified Crops in the EU.
