Petrology--the study of the nature, composition, origin, and history of rocks--is central to understanding Earth history. As students of the planet Earth, every geologist must have a solid foundation in petrology, regardless of specialization or interest.

## Sedimentary And Metamorphic Rocks Study

A metamorphic rock that does not have bands of mineral grains. Sediments. Loose materials such as rock fragments, mineral grains, and bits and pieces of shell that have been moved by wind, water, or ice. Sedimentary rocks. Rocks that form when sediments are pressed together, or when minerals form in solution. Weathering.

Rock Cycle: Igneous, Sedimentary, and Metamorphic Rocks ...

Hi I'm Sedimentary. I was formed over the span of numerous years and years. Although my name wasn't always Sedimentary... My name used to be Metamorphic. I was formed under intense heat, but even though that is how I was created.. it was not how I wanted to live. I was tired of always being compressed by the other rocks on top.

What is the difference among igneous, metamorphic and ...

Igneous and sedimentary rocks mainly undergo this change and become metamorphic rocks. The existing rock type which undergoes a change is referred to as the protolith. Hence, the study of metamorphic rocks provides an understanding of the pressure and temperatures deep within the earth ' s crust. Gneiss, marble, slate, schist, and quartzite are some of the different types of metamorphic rocks.

Rocks: Pictures of Igneous, Metamorphic and Sedimentary Rocks

Slate and chalk are both sedimentary rocks. The sedimentary layers slowly sink into the crust. As the rock sink deeper, the pressure and temperature increase, and the rocks undergo metamorphoses. They are then called metamorphic rocks. Limestone, for example, is transformed into a colorful metamorphic rock, marble. The natural movements of Earth's crust can thrust sedimentary and metamorphic layers toward the surface or push them deeper into the mantle.

Metamorphic petrology involves the study of the composition and texture of metamorphic rocks. Such rocks include marble, gneiss, slate, and schist. Initially, sedimentary or igneous rocks undergo mineralogical, textural and chemical changes because of extreme pressure or temperature, and in some cases due to both.

A rock is any naturally occurring solid mass or aggregate of minerals or mineraloid matter. It is categorized by the minerals included, its chemical composition and the way in which it is formed. Rocks are usually grouped into three main groups: igneous rocks, metamorphic rocks and sedimentary rocks. Rocks form the Earth's outer solid layer, the crust, and most of its interior, except for the ...
