Slate and chalk are both sedimentary rocks. The sedimentary layers slowly sink into the crust. As the rock sink deeper, the pressure and temperature increase, and the rocks undergo metamorphoses. They are then called metamorphic rocks. Limestone, for example, is transformed into a colorful metamorphic rock, marble. The natural movements of Earth's crust can thrust sedimentary and metamorphic layers toward the surface or push them deeper into the mantle.

Petrology--the study of the nature, composition, origin, and history of rocks--is central to understanding Earth history. As students of the planet Earth, every geologist must have a solid foundation in petrology, regardless of specialization or interest.
What Is Petrology? - WorldAtlas
Metamorphic petrology involves the study of the composition and texture of metamorphic rocks. Such rocks include marble, gneiss, slate, and schist. Initially, sedimentary or igneous rocks undergo mineralogical, textural and chemical changes because of extreme pressure or temperature, and in some

cases due to both.

A rock is any naturally occurring solid mass or aggregate of minerals or mineraloid matter. It is categorized by the minerals included, its chemical composition and the way in which it is formed. Rocks are usually grouped into three main groups: igneous rocks, metamorphic rocks and sedimentary rocks.Rocks form the Earth's outer solid layer, the crust, and most of its interior, except for the ...

Igneous, Sedimentary and Metamorphic Rocks - Science Struck

Igneous and sedimentary rocks mainly undergo this change and become metamorphic rocks. The existing rock type which undergoes a change is referred to as the protolith. Hence, the study of metamorphic rocks provides an understanding of the pressure and temperatures deep within the earth ' s crust. Gneiss, marble, slate, schist, and quartzite are some of the different types of metamorphic rocks.

-Igneous rocks form from the cooling and hardening of molten magma in many different environments.

Sedimentary rocks form by the compaction and cementing together of sediments, broken pieces of rock-like gravel, sand, silt, or clay and Metamorphic rocks form when the minerals in an existing rock are changed by heat or pressure below the surface.
