Big Data, Big Analytics CRC Press

Reactors are the basic equipment in any chemical plant. This book describes their process design in terms of numerically solved examples. It covers numerical techniques, analysis of rate data, sizes and performances of ideal reactors, residence time distributions and performance of non-ideal models, solid catalyzed reactions, behavior of porous catalysts, and reactions between multiple phases, including biochemical processes. The 1,000 plus problems are classified into 54 categories. Each of the eight chapters provides definitions and an outline of theory. Solutions are presented mostly as graphs or tables. Some key theoretical developments are given in problem form. The scope is suitable for the first undergraduate course of this topic and for beginning or graduate students, as well as review for professional engineers' examinations.
