Describes digital musical instruments, industries that supply and promote them, and the meanings they have for musicians. Winner of the International Association for the Study of Popular Music (IASPM) Book Award (1997) Recent innovations in musical instrument design are not simply a response to the needs of musicians, writes Paul Th é berge; they also have become "a driving force with which musicians must contend." He argues that digital synthesizers, samplers, and sequencers in studio production and in the home have caused musicians to rely increasingly on manufacturers for both the instruments themselves as well as the very sounds and musical patterns that they use to make music. Musical practices have thus become allied with a new type of consumer practice that is altogether different from earlier relationships between musicians and their instruments as a means of production. Th é berge places these developments within a broad social and historical perspective that examines the development of the musical instrument industry, particularly the piano industry, the economic and cultural role of musicians' magazines and computer networks,

and the fundamental relationships between musical concepts, styles, and technology.

This third, and final, volume is devoted to a discussion of monitoring systems. While the applications of physiological monitoring are many and varied, the primary concern here is with viability monitoring, the use of a measurement system to obtain factual, quantitative information about the physiological responses of a subject in a stressful environment, in order to plan protective measures which will ensure the safety and functional capability of that subject in such environments. Included are a description of instrumentation required for the measurement of individual physiological parameters, a discussion of related problems in system design, including simultaneous measurement of several

parameters, data transmission or telemetry, and the use of magnetic tape recording as a system adjunct. Basic guidelines of system troubleshooting and interference reduction are also included. Section IV contains a brief survey of additional measurement techniques and data handling considerations which, while not state of the art or standard practice, will undoubtedly affect the field of physiological monitoring in the near future.
